### GENERAL DESCRIPTION

The ADG601/ADG602 are monolithic CMOS SPST (Single Pole, Single Throw) switches with On Resistance typically less than 2.5  $\Omega$ . The Low On Resistance flatness makes the ADG601/ADG602 ideally suited to many applications, particularly those requiring low distortion. These switches are ideal for replacements for mechanical relays because they are more reliable, have lower power requirements, and package size is much smaller.

The ADG601 is a normally open (NO) switch, while the ADG602 is normally closed (NC). Each switch conducts equally well in both directions when ON, with the input signal range extending to the supply rails.

They are available in tiny 6-lead SOT-23 and 8-lead Micro-SOIC packages.

## NOTES

<sup>1</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

<sup>2</sup>Overvoltages at IN, S, or D will be clamped by internal diodes. Current should be limited to the maximum ratings given.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADG601/ADG602 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
