## FEATURES

Bandwidth: 230 MHz<br>Low insertion loss and on resistance: $2.6 \Omega$ typical<br>On resistance flatness: $0.3 \Omega$ typical<br>Single 3 V/5 V supply operation<br>3.3 V analog signal range ( 5 V supply, $75 \Omega$ load)<br>Low quiescent supply current: 1 nA typical<br>Fast switching times: ton $=\mathbf{1 8 4} \mathbf{n s}$, toff $=180 \mathrm{~ns}$<br>$I^{2} \mathrm{C}$-compatible interface<br>Compact 24-lead LFCSP<br>Two I ${ }^{2}$ C-controllable logic outputs (ADG799G only)<br>ESD protection<br>4 kV human body model<br>200 V machine model<br>1 kV field-induced charged device model

## APPLICATIONS

## RGB/YPbPr video switches

HDTV
Projection TV
DVD-R/RW
AV receivers

## GENERAL DESCRIPTION

The ADG799A/ADG799G are monolithic CMOS devices comprising three $2 \times 2$ crosspoint switches controllable via a standard $\mathrm{I}^{2} \mathrm{C}$ serial interface. The CMOS process provides ultralow power dissipation, yet offers high switching speed and low on resistance.

The on resistance profile is very flat over the full analog input range and wide bandwidth ensures excellent linearity and low distortion. These features, combined with a wide input signal range, make the ADG799A/ADG799G the ideal switching solution for a wide range of TV applications including RGB and $\mathrm{Y} \operatorname{Pb} \operatorname{Pr}$ video switches for picture-in picture applications.

The switches conduct equally well in both directions when on. In the off condition, signal levels up to the supplies are blocked. The ADG799A/ADG799G switches exhibit break-before-make switching action. The ADG799G has two general-purpose logic output pins controlled by the $\mathrm{I}^{2} \mathrm{C}$ interface that can also be used to control other non- $\mathrm{I}^{2} \mathrm{C}$-compatible devices such as video filters.

The integrated $\mathrm{I}^{2} \mathrm{C}$ interface provides a large degree of flexibility in the system design. It has three user-adjustable $\mathrm{I}^{2} \mathrm{C}$ address

## Rev. 0

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties that may result from its use. Specifications subject to change without notice. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices. Figure 1. ADG799A and ADG799G
pins that allow up to eight devices on the same bus. This allows the user to expand the capability of the device by increasing the size of the switching array.

The ADG799A/ADG799G operate from single 3 V or 5 V supply voltages and are available in a compact, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ body, 24-lead, Pb -free LFCSP.

## PRODUCT HIGHLIGHTS

1. Wide bandwidth: 230 MHz .
2. Ultralow power dissipation.
3. Extended input signal range.
4. Integrated $\mathrm{I}^{2} \mathrm{C}$ serial interface.
5. Compact $4 \mathrm{~mm} \times 4 \mathrm{~mm}, 24$-lead, Pb -free LFCSP.
6. ESD protection tested as per ESD Association standards:

- 4 kV HBM (ANSI/ESD STM5.1-2001)
- 200 V MM (ANSI/ESD STM5.2-1999)
- 1 kV FICDM (ANSI/ESD STM5.3.1-1999)

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

Table 4.

| Parameter | Rating |
| :---: | :---: |
| $V_{\text {DD }}$ to GND | -0.3 V to +6 V |
| Analog, Digital Inputs | -0.3 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ or 30 mA , whichever occurs first |
| Continuous Current, S or D Pins | 100 mA |
| Peak Current, S or D Pins | 300 mA (pulsed at 1 ms , $10 \%$ duty cycle max) |
| Operating Temperature Range Industrial (B Version) | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Junction Temperature | $150^{\circ} \mathrm{C}$ |
| $\theta_{\text {JA }}$ Thermal Impedance |  |
| 24-Lead LFCSP | $30^{\circ} \mathrm{C} / \mathrm{W}$ |
| Lead Temperature, Soldering ( 10 sec ) | $300^{\circ} \mathrm{C}$ |
| IR Reflow, Peak Temperature (<20 sec) | $260^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating can be applied at any one time.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

Table 5. Pin Function Descriptions

| Pin No. | Mnemonic | Function |
| :--- | :--- | :--- |
| 1 | NC | Not internally connected. |
| 2 | S1A | A-Side Source Terminal for Crosspoint Switch 1. Can be an input or output. |
| 3 | D1A | A-Side Drain Terminal for Crosspoint Switch 1. Can be an input or output. |
| 4 | D1B | B-Side Drain Terminal for Crosspoint Switch 1. Can be an input or output. |
| 5 | S1B | B-Side Source Terminal for Crosspoint Switch 1. Can be an input or output. |
| 6 | NC/GPO2 | Not internally connected (for the ADG799A) / General-Purpose Logic Output 2 (for the ADG799G). |
| 7 | NC | Not internally connected. |
| 8 | S2A | A-Side Source Terminal for Crosspoint Switch 2. Can be an input or output. |
| 9 | D2A | A-Side Drain Terminal for Crosspoint Switch 2. Can be an input or output. |
| 10 | D2B | B-Side Drain Terminal for Crosspoint Switch 2. Can be an input or output. |
| 11 | S2B | B-Side Source Terminal for Crosspoint Switch 2. Can be an input or output. |
| 12 | NC/GPO1 | Not internally connected (for the ADG799A) / General-Purpose Logic Output 1 (for the ADG799G). |
| 13 | NC | Not internally connected. |
| 14 | S3B | B-Side Source Terminal for Crosspoint Switch 3. Can be an input or output. |
| 15 | D3A | A-Side Drain Terminal for Crosspoint Switch 3. Can be an input or output |
| 16 | D3B | B-Side Drain Terminal for Crosspoint Switch 3. Can be an input or output. |
| 17 | S3A | A-Side Source Terminal for Crosspoint Switch 3. Can be an input or output. |
| 18 | A2 | Logic Input. Sets Bit A2 from the least significant bits of the 7-bit slave address. |
| 19 | A1 | Logic Input. Sets Bit A1 from the least significant bits of the 7-bit slave address. |
| 20 | A0 | Logic Input. Sets Bit A0 from the least significant bits of the 7-bit slave address. |
| 21 | SCL | Digital Input, Serial Clock Line. Open drain input used in conjunction with SDA to clock data into the device. |
| 22 | SDA | External pull-up resistor required. |
| 23 | Digital Input/Output. Bidirectional open drain data line. External pull-up resistor required. |  |
| 24 | VDD | Positive Power Supply Input. |

## TERMINOLOGY

## On Resistance (Ron)

The series on-channel resistance measured between the $S$ and D pins.

On Resistance Match ( $\Delta \mathrm{R}_{\mathrm{on}}$ )
The channel-to-channel matching of on resistance when channels are operated under identical conditions.

On Resistance Flatness (Rflat(on))
The variation of on resistance over the specified range produced by the specified analog input voltage change with a constant load current.

## Channel Off Leakage ( $\mathrm{I}_{\text {off }}$ )

The sum of leakage currents into or out of an off channel input.

## Channel On Leakage (Ios)

The current loss/gain through an on-channel resistance, creating a voltage offset across the device.

Input Leakage Current ( $\mathbf{I}_{\text {IN }}, \mathbf{I}_{\text {INL }}, \mathbf{I}_{\text {INH }}$ )
The current flowing into a digital input when a specified low level or high level voltage is applied to that input.

## Input/Output Off Capacitance (Coff)

The capacitance between an analog input and ground when the switch channel is off.

## Input/Output On Capacitance (Cos)

The capacitance between the inputs or outputs and ground when the switch channel is on.

## Digital Input Capacitance ( $\mathrm{C}_{\mathrm{IN}}$ )

The capacitance between a digital input and ground.

## Output On Switching Time (tov)

The time required for the switch channel to close. The time is measured from $50 \%$ of the falling edge of the LDSW bit to the time the output reaches $90 \%$ of the final value.

Output Off Switching Time ( $\mathrm{t}_{\text {off }}$ )
The time required for the switch to open. The time is measured from $50 \%$ of the falling edge of the LDSW bit to the time the output reaches $10 \%$ of the final value.

## $I^{2} \mathrm{C}$ to GPO Propagation Delay ( $\mathrm{t}_{\mathrm{H}}, \mathrm{t}_{\mathrm{L}}$ )

The time required for the logic value at the GPO pin to settle after loading a GPO command. The time is measured from $50 \%$ of the falling edge of the LDSW bit to the time the output reaches $90 \%$ of the final value for high and $10 \%$ for low.

Total Harmonic Distortion + Noise (THD + N)
The ratio of the harmonic amplitudes plus noise of a signal to the fundamental.

## -3 dB Bandwidth

The frequency at which the output is attenuated by 3 dB .

## Off Isolation

The measure of unwanted signal coupling through an off switch.

## Crosstalk

The measure of unwanted signal that is coupled through from one channel to another because of parasitic capacitance.

## Charge Injection

The measure of the glitch impulse transferred from the digital input to the analog output during on/off switching.

## Differential Gain Error

The measure of how much color saturation shift occurs when the luminance level changes. Both attenuation and amplification can occur; therefore, the largest amplitude change between any two levels is specified and expressed in \%.

## Differential Phase Error

The measure of how much hue shift occurs when the luminance level changes. It can be a negative or positive value and is expressed in degrees of subcarrier phase.

Input High Voltage ( $\mathrm{V}_{\mathrm{INH}}$ )
The minimum input voltage for Logic 1.
Input Low Voltage ( $\mathrm{V}_{\text {INL }}$ )
The maximum input voltage for Logic 0 .

## Output High Voltage ( $\mathrm{V}_{\mathrm{OH}}$ )

The minimum output voltage for Logic 1.
Output Low Voltage (Vos)
The maximum output voltage for Logic 0 .
I $_{\text {DD }}$
Positive supply current.

## THEORY OF OPERATION

The ADG799A/ADG799G are monolithic CMOS device comprising three $2 \times 2$ crosspoint switches controllable via a standard I ${ }^{2} \mathrm{C}$ serial interface. The CMOS process provides ultralow power dissipation, yet offers high switching speed and low on resistance.

The on resistance profile is very flat over the full analog input range, and wide bandwidth ensures excellent linearity and low distortion. These features, combined with a wide input signal range, make the ADG799A/ADG799G an ideal switching solution for a wide range of TV applications.

The switches conduct equally well in both directions when on. In the off condition, signal levels up to the supplies are blocked. The integrated serial $I^{2} \mathrm{C}$ interface controls the operation of the crosspoint switches (ADG799A/ADG799G) and generalpurpose logic pins (ADG799G only).

The ADG799A/ADG799G have many attractive features, such as the ability to individually control each switch, the option of reading back the status of any switch. The ADG799G has two generalpurpose logic output pins controllable through the $\mathrm{I}^{2} \mathrm{C}$ interface. The following sections describe these features in more detail.

## $I^{2} \mathrm{C}$ SERIAL INTERFACE

The ADG799A/ADG799G are controlled via an I ${ }^{2} \mathrm{C}$-compatible serial bus interface (refer to the $I^{2} C$-Bus Specification available from Philips Semiconductor) that allows the part to operate as a slave device (no clock is generated by the ADG799A/ADG799G). The communication protocol between the $\mathrm{I}^{2} \mathrm{C}$ master and the device operates as follows:

1. The master initiates data transfer by establishing a start condition (defined as a high-to-low transition on the SDA line while SCL is high). This indicates that an address/data stream follows. All slave devices connected to the bus respond to the start condition and shift in the next eight bits, consisting of a seven bit address (MSB first) plus an $\mathrm{R} / \overline{\mathrm{W}}$ bit. This bit determines the direction of the data flow during the communication between the master and the addressed slave device.
2. The slave device whose address corresponds to the transmitted address responds by pulling the SDA line low during the ninth clock pulse (this is known as the acknowledge bit).

At this stage, all other devices on the bus remain idle while the selected device waits for data to be written to, or read from, its serial register. If the $\mathrm{R} / \overline{\mathrm{W}}$ bit is set high, the master reads from the slave device. However, if the $\mathrm{R} / \overline{\mathrm{W}}$ bit is set low, the master writes to the slave device.
3. Data transmits over the serial bus in sequences of nine clock pulses (eight data bits followed by an acknowledge bit). The transitions on the SDA line must occur during the low period of the clock signal, SCL, and remain stable during the high period of SCL. Otherwise, a low-to-high transition when the clock signal is high can be interpreted as a stop event that ends the communication between the master and the addressed slave device.
4. After transferring all data bytes, the master establishes a stop condition, defined as a low-to-high transition on the SDA line while SCL is high. In write mode, the master pulls the SDA line high during the $10^{\text {th }}$ clock pulse to establish a stop condition. In read mode, the master issues a no acknowledge for the ninth clock pulse (the SDA line remains high). The master then brings the SDA line low before the $10^{\text {th }}$ clock pulse, and then high during the $10^{\text {th }}$ clock pulse to establish a stop condition.

## $I^{2}$ C ADDRESS

The ADG799A/ADG799G each have a seven-bit $\mathrm{I}^{2} \mathrm{C}$ address. The four most significant bits are internally hardwired while the last three bits (A0, A1, and A2) are user-adjustable. This allows the user to connect up to eight ADG799A/ADG799Gs to the same bus. The $I^{2} \mathrm{C}$ bit map shows the configuration of the seven-bit address.

| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## WRITE OPERATION

When writing to the ADG799A/ADG799G, the user must begin with an address byte and $\mathrm{R} / \overline{\mathrm{W}}$ bit. Next, the switch acknowledges that it is prepared to receive data by pulling SDA low. Data is loaded into the device as a 16 -bit word under the control of a serial clock input, SCL. Figure 31 illustrates the entire write sequence for the ADG799A/ADG799G. The first data byte (AX7 to AX0) controls the status of the crosspoint switches and the GPO pins, while the LDSW and RESETB bits from the second byte controls the operation mode of the device. Table 6 shows a list of all commands supported by the ADG799A/ADG799G with the corresponding byte that needs to be loaded during a write operation.

To achieve the desired configuration, one or more commands can be loaded into the device. Any combination of the commands listed in Table 6 can be used with the following restrictions:

- The commands referring to more than one switch overwrite any previous command.
- When a sequence of successive commands affect the same element (that is, the switch or GPO pin), only the last command is executed.

[^2]
## ADG799A/ADG799G

## LDSW BIT

The LDSW bit allows the user to control the way the device executes the commands loaded during the write operations. The ADG799A/ADG799G execute all the commands loaded between two successive write operations that have set the LDSW bit high.

Setting the LDSW high for every write cycle ensures that the device executes the command immediately after the LDSW bit is loaded into the device. This setting can be used when the desired configuration can be achieved by sending a single command or when the switches and/or GPO pins are not required to be updated at the same time. When the desired configuration requires multiple commands with simultaneous updates, the LDSW bit should be set low while loading the commands except for the last one when the LDSW bit should be set high. Once the last command with LDSW = high is loaded, the device simultaneously executes all commands received since the last update.

## POWER ON/SOFTWARE RESET

The ADG799A/ADG799G has a software reset function implemented by the RESETB bit from the second data byte written to the device. For normal operation of the crosspoint switch and GPO pins, this bit should be set high. When RESETB = low or after power-up, the switches from all crosspoint switch pins are turned off (open) and the GPO pins are set low.

## READ OPERATION

When reading data back from the ADG799A/ADG799G, the user must begin with an address byte and $\mathrm{R} / \overline{\mathrm{W}}$ bit. The switch then acknowledges that it is prepared to transmit data by pulling SDA low. Following this acknowledgement, the ADG799A/ADG799G transmit two bytes on the next clock edges. These bytes contain the status of the switches, and each byte is followed by an acknowledge bit. A logic high bit represents a switch in the on (close) state while a low represents a switch in the off (open) state. For the GPO pins (ADG799G only), the bit represents the logic value of the pin. Figure 32 illustrates the entire read sequence.

The bit maps accompanying Figure 32 show the relationship between the elements of the ADG799A and ADG799G (that is, the switches and GPO pins) and the bits that represent their status after a completed read operation.

## ADG799A/ADG799G

## EVALUATION BOARD

The EVAL-ADG799GEB allows designers to evaluate the high performance of the device with minimum effort.

The evaluation kit includes a printed circuit board populated with the ADG799G. The evaluation board can be used to evaluate the performance of both the ADG799A and ADG799G. It interfaces to the USB port of a PC, or it can be used as a standalone evaluation board. Software is available with the evaluation board that allows the user to easily program the ADG799G through the USB port. Schematics of the evaluation board are shown in Figure 33 and Figure 34. The software runs on any PC with Microsoft ${ }^{\bullet}$ Windows ${ }^{*} 2000$ or Windows XP and a minimum screen resolution of $1200 \times 768$.

## USING THE ADG799G EVALUATION BOARD

The ADG799G evaluation kit is a test system designed to simplify the evaluation of the device. Each input/output of the part comes with a socket specifically chosen for easy audio/video evaluation. A data sheet is also available with the evaluation board offering full information on how to operate the evaluation board.

ORDERING GUIDE

| Model | Temperature Range | $1^{2} \mathrm{C}$ Speed | Package Description | Package Option |
| :---: | :---: | :---: | :---: | :---: |
| ADG799ABCPZ-REEL ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799ABCPZ-500RL7 ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799ACCPZ-REEL ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}, 3.4 \mathrm{MHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799ACCPZ-500RL7 ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}, 3.4 \mathrm{MHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799GBCPZ-REEL ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799GBCPZ-500RL7 ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799GCCPZ-REEL ${ }^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}, 3.4 \mathrm{MHz}$ | 24-Lead LFCSP_VQ | CP-24-2 |
| ADG799GCCPZ-500RL71 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $100 \mathrm{kHz}, 400 \mathrm{kHz}, 3.4 \mathrm{MHz}$ | 24-Lead LFCSP_VQ <br> Evaluation Board | CP-24-2 |

## NOTES

[^0]:    ${ }^{1}$ All typical values are at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise stated.
    ${ }^{2}$ Guaranteed by initial characterization, not subject to production test.
    ${ }^{3}$ Guaranteed by design, not subject to production test.

[^1]:    ${ }^{1}$ All typical values are at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise stated.
    ${ }^{2}$ Guaranteed by initial characterization, not subject to production test.
    ${ }^{3}$ Guaranteed by design, not subject to production test.

[^2]:    ${ }^{1} \mathrm{X}=$ Logic state does not matter.

[^3]:    ${ }^{1} \mathrm{Z}=\mathrm{Pb}$-free part.
    ${ }^{2}$ Evaluation board is RoHS compliant.
