

STA559BWQS

5-V, 2-A, 2.1-channel high-efficiency digital audio system with QSound QHD[®]

Features

- Wide supply voltage range (4.5 - 9 V)
 - 3 Power output configurations:
 - 2 channels of ternary PWM (stereo mode) (2 x 3 W) into 4 Ω at 5 V
 - 3 channels - left, right using binary and LFE using ternary PWM (2.1 mode) (2 x 0.7 W + 1 x 3 W) into 4 Ω at 5 V (2 x 1.4 W + 1 x 6 W) into 2 Ω at 5 V
 - 2 channels of ternary PWM (2 x 3 W) + PWM driver for SW
 - 2.1 channels of 24-bit DDX[®]
 - 100-dB SNR and dynamic range
 - Selectable 32 kHz to 192 kHz input sample rates
 - I²C control with selectable device address
 - Digital gain/attenuation +48 dB to -80 dB in 0.5-dB steps
 - Soft volume update
 - Individual channel and master gain/attenuation
 - Dual independent limiters/compressors
 - Dynamic range compression or anti-clipping modes
 - AutoModes
 - 15 preset crossover filters
 - 2 preset anti-clipping modes
 - Preset night-time listening mode
 - Individual channel and master soft and hard mute
 - Independent channel volume and DSP bypass
- PowerSSO-36 slug down
- Automatic zero-detect mute
 - Automatic invalid input detect mute
 - 2-channel I²S input data interface
 - Input and output channel mapping
 - 4 28-bit user programmable biquads (EQ) per channel
 - DC blocking selectable high-pass filter
 - Selectable de-emphasis
 - Sub channel mix into left and right channels
 - Advanced AM interference frequency switching and noise-suppression modes
 - Selectable high or low bandwidth noise-shaping topologies
 - Variable max power correction for lower full-power THD
 - Thermal overload and short-circuit protection
 - Video application supports 576 x fs input mode
 - QSound QHD[®]
 - Field proven stereo soundfield enhancement technology
 - Provides improved audio image width, separation and depth for stereo signals
 - Synthesizes a 3-D stereo soundfield
 - PowerSSO-36 slug down package

Table 1. Order codes

Part number	Temp range, °C	Package	Packing
STA559BWQS	0 to 150	PowerSSO-36 slug down	Tube
STA559BWQS13TR	0 to 150	PowerSSO-36 slug down	Tape&Reel

1 Description and block diagram

1.1 Description

The STA559BWQS is an integration of digital audio processing, digital amplifier control, DDX[®] power-output stage and QSound QHD[®] technology to create a high-power single-chip DDX solution with high-quality, high-efficiency and all digital amplification.

The STA559BWQS power section consists of four independent half-bridges. These can be configured via digital control to operate in different modes. 2.1 channels can be provided by two half-bridges and a single full-bridge, providing up to 2 x 0.7 W + 1 x 3 W of power output. 2 channels can be provided by two full-bridges, providing up to 2x3W of power. The IC can also be configured as a 2.1 channels with 2 x 3 W provided by the device and external power for DDX[®] power drive. Also provided in the STA559BWQS are a full assortment of digital processing features. This includes up to 4 programmable 28-bit biquads (EQ) per channel, and bass/treble tone control. AutoModes enable a time-to-market advantage by substantially reducing the amount of software development needed for certain functions, for instance, auto volume loudness, preset volume curves and preset EQ settings. New advanced AM radio interference reduction modes. The serial audio data input interface accepts all possible formats, including the popular I²S format. Three channels of DDX[®] processing are provided. This high quality conversion from PCM audio to DDX patented 3-state PWM switching waveform provides over 100 dB of SNR and dynamic range.

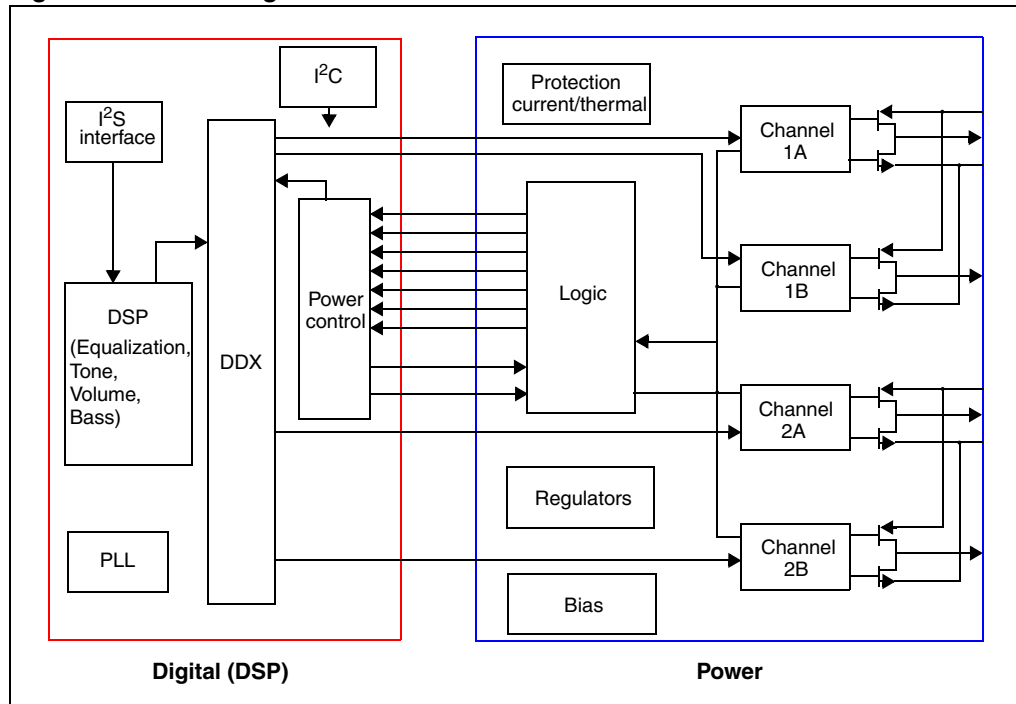

1.2 QSound QHD[®]

Normally, reduced audio clarity is experienced due to the digital compression of music (and video-sound) combined with various audio processing techniques used in broadcast transmission. This is most apparent in products such as digital televisions and audio players. These devices are faced with a multitude of audio challenges, primarily associated with the small speakers, that are limited in location and cabinet housing, plus economized speaker drivers and components. As such digital televisions and audio players are ideal candidates to benefit from stereo soundfield enhancement in order to deliver a full surround-like experience.

QSound QHD[®] and its industry recognized QXpander[®] technology is a field-proven stereo soundfield enhancement technology that provides a broader stereo image width with greater separation and depth for stereo signals and synthesizes a 3-D stereo soundfield. QHD[®] removes the small centralized audio sweet spot by creating a very wide stereo image with full immersive audio. QHD[®] and its QXpander[®] technology have been incorporated into hundreds of QSound and third party hardware and software products, with total shipments in the millions.

2.1 Connections diagram

Figure 2. Pin connection PowerSSO-36 (top view)

2.2 Pins description

Table 2. Pin description

Pin	Type	Name	Description
1	GND	GND_SUB	Substrate ground
2	I	SA	I ² C select address
3	I	TEST_MODE	This pin must be connected to ground
4	I/O	VSS	Internal reference at Vcc - 3.3 V
5	I/O	VCC_REG	Internal Vcc reference
6	O	OUT2B	Output half bridge 2B
7	GND	GND2	Power negative supply
8	Power	VCC2	Power positive supply
9	O	OUT2A	Output half bridge 2A

Table 2. Pin description (continued)

Pin	Type	Name	Description
10	O	OUT1B	Output half bridge 1B
11	Power	VCC1	Power positive supply
12	GND	GND1	Power negative supply
13	I/O	OUT1A	Output half bridge 1A
14	GND	GND_REG	Internal ground reference
15	Power	VDD	Internal 3.3 V reference voltage
16	I/O	GND	Power negative supply
17	O	OUT3B/DDX3B	PWM out CH3B - external bridge
18	O	OUT3A/DDX3A	PWM out CH3A - external bridge
19	O	EAPD/OUT4A	Power down for external bridge
20	I	TWARN/OUT4B	Thermal warning from external bridge
21	Power	VDD_DIG	Digital supply voltage
22	GND	GND_DIG	Digital ground
23	I	PWRDN	Power down
24	Power	VDD_PLL	Positive supply for PLL
25	I	FILTER_PLL	Connection to PLL filter
26	GND	GND_PLL	Negative supply for PLL
27	I	XTI	PLL input clock
28	I	BICKI	I ² S serial clock
29	I	LRCKI	I ² S left/right clock
30	I	SDI	I ² S serial data channels 1 and 2
31	I	RESET	Reset
32	O	INT_LINE	Fault interrupt
33	I/O	SDA	I ² C serial data
34	I	SCL	I ² C serial clock
35	GND	GND_DIG	Digital ground
36	Power	VDD_DIG	Digital supply voltage

2.3 Thermal data

Table 3. Thermal data

Symbol	Parameter	Min	Typ	Max	Unit
$R_{th\ j-amb}$	Thermal resistance junction-ambient PowerSSO-36 ⁽¹⁾		24		°C/W
T_{th-sdj}	Thermal shut-down junction temperature		150		°C
T_{th-w}	Thermal warning temperature		130		°C
T_{th-sdh}	Thermal shut-down hysteresis temperature		25		°C

1. See [Chapter 7: Package thermal characteristics on page 61](#) for details.

3 Electrical specifications

3.1 Absolute maximum ratings

Table 4. Absolute maximum ratings

Symbol	Parameter	Min	Typ	Max	Unit
V _{cc}	Power supply voltage (VCC1, VCC2)			18	V
V _{dd}	Logic supply	-0.3		4	V
T _{op}	Operating junction temperature	-20		150	°C
T _{stg}	Storage temperature	-40		150	°C

Note: Stresses beyond those listed under “Absolute maximum ratings” make cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “Recommended operating condition” are not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. In the real application, power supply with nominal value rated inside recommended operating conditions, may experience some rising beyond the maximum operating condition for short time when no or very low current is sinked (amplifier in mute state). In this case the reliability of the device is guaranteed, provided that the absolute maximum rating is not exceeded.

3.2 Recommended operating condition

Table 5. Recommended operating condition

Symbol	Parameter	Min	Typ	Max	Unit
V _{cc}	Power supply voltage (VCC1, VCC2)	5.0		16.0	V
V _{dd}	Logic supply	2.7	3.3	3.6	V
T _{amb}	Ambient temperature	-20		70	°C

3.3 Electrical specifications - digital section

Table 6. Electrical specifications - digital section

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I_{il}	Low level input current without pull device	$V_i = 0 \text{ V}$	-10		10	μA
I_{ih}	High level input current without pull device	$V_i = V_{DD_DIG} = 3.6 \text{ V}$	-10		10	μA
V_{il}	Low level input voltage				$0.2 * V_{DD_DIG}$	V
V_{ih}	High level input voltage		$0.8 * V_{DD_DIG}$			V
V_{ol}	Low level output voltage	$I_{ol} = 2 \text{ mA}$			$0.4 * V_{DD_DIG}$	V
V_{oh}	High level output voltage	$I_{oh} = 2 \text{ mA}$	$0.8 * V_{DD_DIG}$			V
I_{pu}	Pull current		-25	66	125	μA
R_{pu}	Equivalent pull resistance			50		$\text{k}\Omega$

3.4 Electrical specifications - power Section

The specifications given in this section are with the operating conditions $V_{CC} = 5 \text{ V}$, $f_{sw} = 384 \text{ kHz}$, $T_{amb} = 25^\circ \text{ C}$, $R_L = 4 \Omega$ unless otherwise specified.

Table 7. Electrical specifications - power Section

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R_{dsON}	Power Pchannel/Nchannel MOSFET RdsON	$I_d = 1 \text{ A}$		180	250	$\text{m}\Omega$
I_{dss}	Power Pchannel/Nchannel leakage Idss	$V_{cc} = 9 \text{ V}$			10	μA
g_P	Power Pchannel RdsON Matching	$I_d = 1 \text{ A}$	95			%
g_N	Power Nchannel RdsON Matching	$I_d = 1 \text{ A}$	95			%
I_{LDT}	Low current dead time (static)	Resistive load ⁽¹⁾		5	10	ns
I_{HDT}	High current dead time (dynamic)	$I_{load} = 2 \text{ A}$ ⁽²⁾		10	20	ns
t_r	Rise time	Resistive load ⁽¹⁾		8	10	ns
t_f	Fall time	Resistive load ⁽¹⁾		8	10	ns
V_{CC}	Supply operating voltage		4.5		16	V
I_{CC}	Supply current from Vcc in power down	Power Down = 0			10	μA
	Supply current from Vcc in 3-state	TRISTATE = 0		15		mA
	Supply current from Vcc in operation	PCM input signal = -60 dBFS Switching frequency = 384 kHz No LC filters		30		mA
	Supply current DDX processing (reference only) on VDD_DIG	Internal clock = 49.152 MHz		80		mA

Table 7. Electrical specifications - power Section (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
I _{lim}	Overcurrent limit		2.2	3.0		A	
I _{sc}	Short circuit protection		2.7	3.6		A	
UVL	Under voltage protection threshold			3.5	4.3	V	
t _{min}	Output minimum pulse width	No Load	20	30	60	ns	
P _o	Output power BTL	THD = 1%, f = 1 kHz		2.3		W	
		THD = 10%, f = 1 kHz		3			
	Output power SE	THD = 1%, f = 1 kHz		0.5		W	
		THD = 10%, f = 1 kHz		0.7			
	Output power BTL	R _L = 8 Ω V _{CC} = 9 V f = 1 kHz	THD = 1%		4.2		W
			THD = 10%		5.3

4 I²C bus specification

The STA559BWQS supports the I²C protocol via the input ports SCL and SDA_IN (master to slave) and the output port SDA_OUT (slave to master). This protocol defines any device that sends data on to the bus as a transmitter and any device that reads the data as a receiver. The device that controls the data transfer is known as the master and the other as the slave. The master always starts the transfer and provides the serial clock for synchronization. STA559BWQS is always a slave device in all of its communications. It supports up to 400 kb/s rate (fast-mode bit rate). STA559BWQS I²C is a slave only interface.

4.1 Communication protocol

4.1.1 Data transition or change

Data changes on the SDA line must only occur when the SCL clock is low. SDA transition while the clock is high is used to identify a START or STOP condition.

4.1.2 Start condition

START is identified by a high to low transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A START condition must precede any command for data transfer.

4.1.3 Stop condition

STOP is identified by low to high transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A STOP condition terminates communication between STA559BWQS and the bus master.

4.1.4 Data input

During the data input the STA559BWQS samples the SDA signal on the rising edge of clock SCL. For correct device operation the SDA signal must be stable during the rising edge of the clock and the data can change only when the SCL line is low.

4.2 Device addressing

To start communication between the master and the STA559BWQS, the master must initiate with a start condition. Following this, the master sends onto the SDA line 8-bits (MSB first) corresponding to the device select address and read or write mode.

The 7 most significant bits are the device address identifiers, corresponding to the I²C bus definition. In the STA559BWQS the I²C interface has two device addresses depending on the SA port configuration, 0x38 when SA = 0, and 0x3A when SA = 1.

The 8th bit (LSB) identifies read or write operation RW, this bit is set to 1 in read mode and 0 for write mode. After a START condition the STA559BWQS identifies on the bus the device address and if a match is found, it acknowledges the identification on SDA bus during the 9th bit time. The byte following the device identification byte is the internal space address.

4.3 Write operation

Following the START condition the master sends a device select code with the RW bit set to 0. The STA559BWQS acknowledges this and the writes for the byte of internal address. After receiving the internal byte address the STA559BWQS again responds with an acknowledgement.

4.3.1 Byte write

In the byte write mode the master sends one data byte, this is acknowledged by the STA559BWQS. The master then terminates the transfer by generating a STOP condition.

4.3.2 Multi-byte write

The multi-byte write modes can start from any internal address. The master generating a STOP condition terminates the transfer.

4.4 Read operation

4.4.1 Current address byte read

Following the START condition the master sends a device select code with the RW bit set to 1. The STA559BWQS acknowledges this and then responds by sending one byte of data. The master then terminates the transfer by generating a STOP condition.

4.4.2 Current address multi-byte read

The multi-byte read modes can start from any internal address. Sequential data bytes will be read from sequential addresses within the STA559BWQS. The master acknowledges each data byte read and then generates a STOP condition terminating the transfer.

4.4.3 Random address byte read

Following the START condition the master sends a device select code with the RW bit set to 0. The STA559BWQS acknowledges this and then the master writes the internal address byte. After receiving, the internal byte address the STA559BWQS again responds with an acknowledgement. The master then initiates another START condition and sends the device select code with the RW bit set to 1. The STA559BWQS acknowledges this and then responds by sending one byte of data. The master then terminates the transfer by generating a STOP condition.

4.4.4 Random address multi-byte read

The multi-byte read modes could start from any internal address. Sequential data bytes will be read from sequential addresses within the STA559BWQS. The master acknowledges each data byte read and then generates a STOP condition terminating the transfer.

5.1 Configuration register A (addr 0x00)

D7	D6	D5	D4	D3	D2	D1	D0
FDRB	TWAB	TWRB	IR1	IR0	MCS2	MCS1	MCS0
0	1	1	0	0	0	1	1

5.1.1 Master clock select

Table 10. Master clock select

Bit	RW	RST	Name	Description
0	RW	1	MCS0	Master clock select: selects the ratio between the input I ² S sample frequency and the input clock.
1	RW	1	MCS1	
2	RW	0	MCS2	

The STA559BWQS will support sample rates of 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 176.4 kHz, and 192 kHz. Therefore the internal clock will be:

- 32.768 MHz for 32 kHz
- 45.1584 MHz for 44.1 kHz, 88.2 kHz, and 176.4 kHz
- 49.152 MHz for 48 kHz, 96 kHz, and 192 kHz

The external clock frequency provided to the XTI pin must be a multiple of the input sample frequency, f_s .

The relationship between the input clock and the input sample rate is determined by both the MCSx and the IR (input rate) register bits. The MCSx bits determine the PLL factor generating the internal clock and the IR bit determines the oversampling ratio used internally

Table 11. Input sample rates and clock select

Input sample rate f_s (kHz)	IR	MCS[2:0]					
		101	100	011	010	001	000
32, 44.1, 48	00	576 fs	128 fs	256 fs	384 fs	512 fs	768 fs
88.2, 96	01	NA	64 fs	128 fs	192 fs	256 fs	384 fs
176.4, 192	1X	NA	32 fs	64fs	96 fs	128 fs	192 fs

5.1.2 Interpolation ratio select

Table 12. Interpolation ratio select

Bit	RW	RST	Name	Description
4..3	RW	00	IR [1:0]	Interpolation ratio select: selects internal interpolation ratio based on input I ² S sample frequency

The STA559BWQS has variable interpolation (oversampling) settings such that internal processing and DDX output rates remain consistent. The first processing block interpolates by either 2-times or 1-time (pass-through) or provides a 2-times downsample. The oversampling ratio of this interpolation is determined by the IR bits.

Table 13. IR bit settings as a function of input sample rate

Input sample rate f_s (kHz)	IR	1st stage interpolation ratio
32	00	2 times oversampling
44.1	00	2 times oversampling
48	00	2 times oversampling
88.2	01	Pass-through
96	01	Pass-through
176.4	10	2 times downsampling
192	10	2 times downsampling

5.1.3 Thermal warning recovery bypass

Table 14. Thermal warning recovery bypass

Bit	RW	RST	Name	Description
5	RW	1	TWRB	Thermal-warning recovery bypass: 0: Thermal warning recovery enabled 1: Thermal warning recovery disabled

If thermal warning adjustment is enabled (TWAB = 0), then the thermal warning recovery will determine if the -3 dB output limit is removed when thermal warning is negative.

If TWRB = 0 and TWAB = 0, then when a thermal warning disappears the -3 dB output limit will be removed and the gain will be added back to the system. If TWRB = 1 and TWAB = 0, then when a thermal warning disappears the -3 dB output limit will remain until TWRB is changed to zero or the device is reset.

5.1.4 Thermal warning adjustment bypass

Table 15. Thermal warning adjustment bypass

Bit	RW	RST	Name	Description
6	RW	1	TWAB	Thermal-warning adjustment bypass: 0: Thermal warning adjustment enabled 1: Thermal warning adjustment disabled

The on-chip STA559BWQS power output block provides feedback to the digital controller using inputs to the power control block. The TWARN input is used to indicate a thermal warning condition. When TWARN is asserted (set to 0) for a period of time greater than 400 ms, the power control block will force a -3 dB output limit (determined by TWOCCL in Coeff RAM) to the modulation limit in an attempt to eliminate the thermal warning condition. Once the thermal warning output limit adjustment is applied, it remains in this state until reset, unless FDRB = 0.

5.1.5 Fault detect recovery bypass

Table 16. Fault detect recovery bypass

Bit	RW	RST	Name	Description
7	RW	0	FDRB	Fault-detect recovery bypass: 0: Fault detect recovery enabled 1: Fault detect recovery disabled

The on-chip STA559BWQS power output block provides feedback to the digital controller using inputs to the power control block. The FAULT input is used to indicate a fault condition (either over-current or thermal). When FAULT is asserted (set to 0), the power control block will attempt a recovery from the fault by asserting the 3-state output (setting it to 0 which directs the power output block to begin recovery), hold it at 0 for period of time in the range of 0.1 ms to 1 s as defined by the fault-detect recovery constant register (FDRC registers 0x29 - 0x2A), then toggle it back to 1. This sequence is repeated as long as the fault indication exists. This feature is enabled by default but can be bypassed by setting the FDRB control bit to 1.

5.2 Configuration register B (addr 0x01)

5.2.1 Serial audio input interface format

Table 17. Serial audio input interface format

Bit	RW	RST	Name	Description
0	RW	0	SAI0	Serial audio input interface format: determines the interface format of the input serial digital audio interface.
1	RW	0	SAI1	
2	RW	0	SAI2	
3	RW	0	SAI3	

5.2.2 Serial data interface

The STA559BWQS audio serial input was designed to interface with standard digital audio components and to accept a number of serial data formats. STA559BWQS always acts a slave when receiving audio input from standard digital audio components. Serial data for two channels is provided using 3 inputs: left/right clock LRCKI, serial clock BICKI, and serial data 1 & 2 SDI12.

The SAI register (Configuration Register B - 01h, Bits D3-D0) and the SAIFB register (configuration register B - 01h, Bit D4) are used to specify the serial data format. The default serial data format is I²S, MSB-First. Available formats are shown in the tables and figure that follow.

5.2.3 Serial data first bit

Table 18. Serial data first bit

SAIFB	Format
0	MSB-first
1	LSB-first

Table 27. Over-current warning detect adjustment bypass

Bit	RW	RST	Name	Description
7	RW	1	OCRB	Over-current warning adjustment bypass: 0: Over-current warning adjustment enabled 1: Over-current warning adjustment disabled

The OCWARN input is used to indicate an over-current warning condition. When OCWARN is asserted (set to 0), the power control block will force a adjustment to the modulation limit (default -3 dB) in an attempt to eliminate the over-current warning condition. Once the over-current warning volume adjustment is applied, it remains in this state until reset is applied. The level of adjustment can be changed via the TWOCL (Thermal Warning/Over Current Limit) setting which is address 0 x 37 of the user defined coefficient RAM.

5.4 Configuration register D (addr 0x03)

D7	D6	D5	D4	D3	D2	D1	D0
MME	ZDE	DRC	BQL	PSL	DSPB	DEMP	HPB
0	1	0	0	0	0	0	0

5.4.1 High-pass filter bypass

Table 28. High-pass filter bypass

Bit	RW	RST	Name	Description
0	RW	0	HPB	High-pass filter bypass bit. setting of one bypasses internal AC coupling digital high-pass filter.

The STA559BWQS features an internal digital high-pass filter for the purpose of AC coupling. The purpose of this filter is to prevent DC signals from passing through a DDX amplifier. DC signals can cause speaker damage. When HPB = 0, this filter is enabled.

5.4.2 De-emphasis

Table 29. De-emphasis

Bit	RW	RST	Name	Description
1	RW	0	DEMP	De-emphasis: 0: No de-emphasis 1: De-emphasis

Setting the DEMP bit enables de-emphasis on all channels

5.4.3 DSP bypass

Table 30. DSP bypass

Bit	RW	RST	Name	Description
2	RW	0	DSPB	DSP bypass bit: 0: Normal operation 1: Bypass of biquad and bass/treble functionality

Setting the DSPB bit bypasses the EQ functionality of the STA559BWQS.

5.4.4 Post-scale link

Table 31. Post-scale link

Bit	RW	RST	Name	Description
3	RW	0	PSL	Post-scale link: 0: Each channel uses individual post-scale value 1: Each channel uses channel 1 post-scale value

Post-scale functionality can be used for power-supply error correction. For multi-channel applications running off the same power-supply, the post-scale values can be linked to the value of channel 1 for ease of use and update the values faster.

5.4.5 Biquad coefficient link

Table 32. Biquad coefficient link

Bit	RW	RST	Name	Description
4	RW	0	BQL	Biquad link: 0: Each channel uses coefficient values 1: Each channel uses channel 1 coefficient values

For ease of use, all channels can use the biquad coefficients loaded into the channel 1 coefficient RAM space by setting the BQL bit to 1. Therefore, any EQ updates only have to be performed once.

5.4.6 Dynamic range compression/anti-clipping bit

Table 33. Dynamic range compression/anti-clipping bit

Bit	RW	RST	Name	Description
5	RW	0	DRC	Dynamic range compression/anti-clipping 0: Limiters act in anti-clipping mode 1: Limiters act in dynamic range compression mode

Both limiters can be used in one of two ways, anti-clipping or dynamic range compression. When used in anti-clipping mode the limiter threshold values are constant and dependent on the limiter settings. In dynamic range compression mode the limiter threshold values vary with the volume settings allowing a nighttime listening mode that provides a reduction in the dynamic range regardless of the volume level.

5.4.7 Zero-detect mute enable

Table 34. Zero-detect mute enable

Bit	RW	RST	Name	Description
6	RW	1	ZDE	Zero-detect mute enable: setting of 1 enables the automatic zero-detect mute

Setting the ZDE bit enables the zero-detect automatic mute. The zero-detect circuit looks at the data for each processing channel at the output of the crossover (bass management) filter. If any channel receives 2048 consecutive zero value samples (regardless of fs) then that individual channel is muted if this function is enabled.

5.4.8 MiamiMode enable

Table 35. MiamiMode enable

Bit	RW	RST	Name	Description
7	RW	0	MME	Miami-Mode enable: 0: Sub mix into left/right disabled 1: Sub mix into left/right enabled

5.5 Configuration register E (addr 0x04)

SVE	ZCE	DCCV	PWMS	AME	NSBW	MPC	MPCV
1	1	0	0	0	0	1	0

5.5.1 Max power correction variable

Table 36. Max power correction variable

Bit	RW	RST	Name	Description
0	RW	0	MPCV	Max power correction variable: 0: Use standard MPC coefficient 1: Use MPCC bits for MPC coefficient

5.5.2 Max power correction

Table 37. Max power correction

Bit	RW	RST	Name	Description
1	RW	1	MPC	Max power correction: setting of 1 enables power bridge correction for THD reduction near maximum power output.

Setting the MPC bit turns on special processing that corrects the STA50x power device at high power. This mode should lower the THD + N of a full DDX system at maximum power output and slightly below. If enabled, MPC is operational in all output modes except tapered (OM[1,0] = 01) and binary. When OCFG = 00, MPC will not effect channels 3 and 4, the line-out channels.

5.5.3 Noise-shaper bandwidth selection

Table 38. Noise-shaper bandwidth selection

Bit	RW	RST	Name	Description
2	RW	0	NSBW	Noise-shaper bandwidth selection: 1 - 3 rd order NS 0 - 4 th order NS

5.5.4 AM mode enable

Table 39. AM mode enable

Bit	RW	RST	Name	Description
3	RW	0	AME	AM mode enable: 0 - Normal DDX operation. 1 - AM reduction mode DDX operation

STA559BWQS features a DDX processing mode that minimizes the amount of noise generated in frequency range of AM radio. This mode is intended for use when DDX is operating in a device with an AM tuner active. The SNR of the DDX processing is reduced to ~83 dB in this mode, which is still greater than the SNR of AM radio.

5.5.5 PWM speed mode

Table 40. PWM speed mode

Bit	RW	RST	Name	Description
4	RW	0	PWMS	PWM speed selection: 0 - Normal speed (384 kHz) all channels 1 - Odd speed (341.3k Hz) all channels

5.5.6 Distortion compensation variable enable

Table 41. Distortion compensation variable enable

Bit	RW	RST	Name	Description
5	RW	0	DCCV	Distortion compensation variable enable: 0 - Uses preset DC coefficient. 1 - Uses DCC coefficient.

5.5.7 Zero-crossing volume enable

Table 42. Zero-crossing volume enable

Bit	RW	RST	Name	Description
6	RW	1	ZCE	Zero-crossing volume enable: 1 - Volume adjustments will only occur at digital zero-crossings 0 - Volume adjustments will occur immediately

The ZCE bit enables zero-crossing volume adjustments. When volume is adjusted on digital zero-crossings no clicks will be audible.

5.5.8 Soft volume update enable

Table 43. Soft volume update enable

Bit	RW	RST	Name	Description
7	RW	1	SVE	Soft volume enable: 1: Volume adjustments ramp according to SVR settings 0: Volume adjustments will occur immediately

5.6 Configuration register F (addr 0x05)

1	RW	0	OCFG1	

Table 45. Output configuration engine selection

OCFG[1:0]	Output configuration	Config pin
00	2 channel (full-bridge) power, 2 channel data-out: 1A/1B → 1A/1B 2A/2B → 2A/2B LineOut1 → 3A/3B LineOut2 → 4A/4B Line out configuration determined by LOC register	0
01	2 (half-bridge), 1 (full-bridge) on-board power: 1A → 1A Binary 0° 2A → 1B Binary 90° 3A/3B → 2A/2B Binary 45° 1A/B → 3A/B Binary 0° 2A/B → 4A/B Binary 90°	0
10	2 channel (full-bridge) power, 1 channel DDX: 1A/1B → 1A/1B 2A/2B → 2A/2B 3A/3B → 3A/3B EAPDTEXT and TWARDNEXT active	0

Note: To the left of the arrow is the processing channel. Note that though the defaults are shown, using channel output mapping, any of the three processing channel outputs can be used for any of the three inputs

Figure 29. OCFG = 00 (default value)

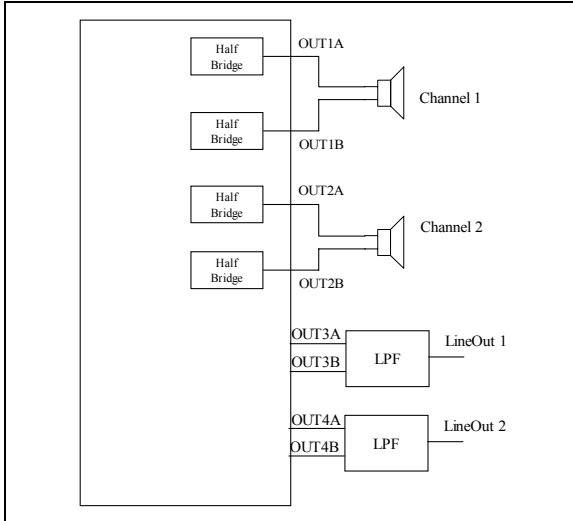

Figure 30. OCFG = 01

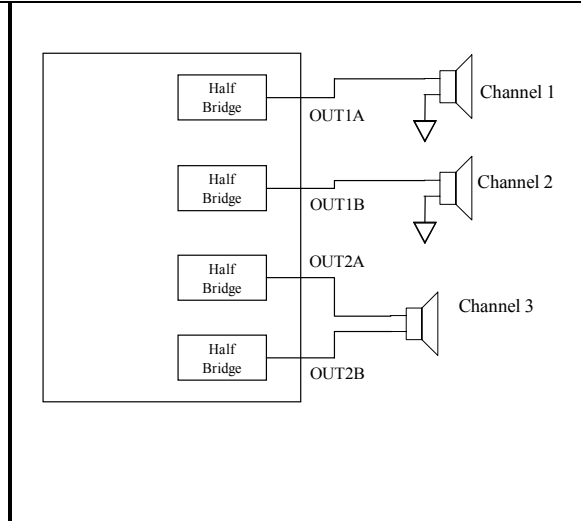

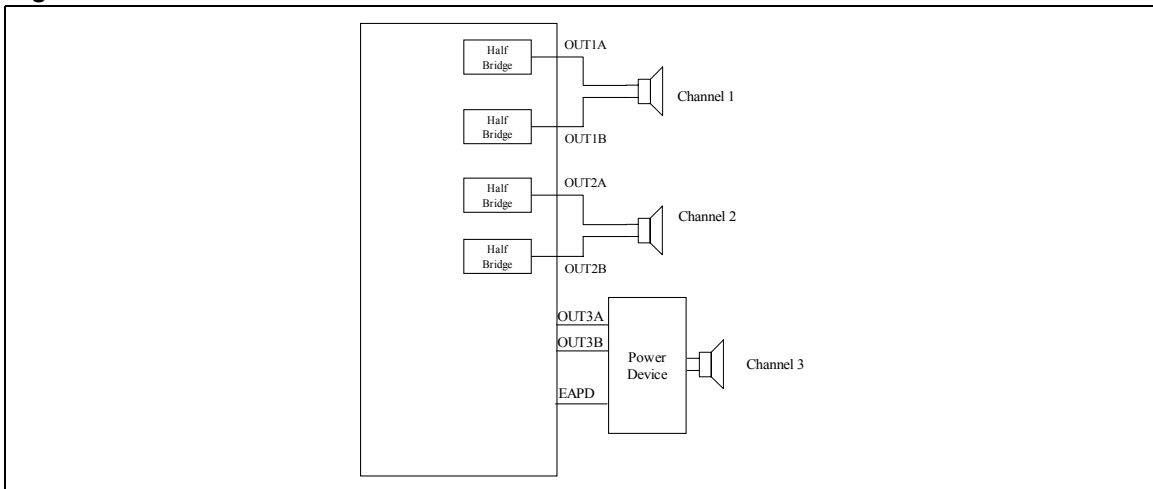

Figure 31. OCFG = 10

5.6.2 Invalid input detect mute enable

Table 46. Invalid input detect mute enable

Bit	RW	RST	Name	Description
2	RW	1	IDE	Invalid input detect mute enable: setting of 1 enables the automatic invalid input detect mute

Setting the IDE bit enables this function, which looks at the input I²S data and will automatically mute if the signals are perceived as invalid.

5.6.3 Binary output mode clock loss detection

Table 47. Binary output mode clock loss detection

Bit	RW	RST	Name	Description
3	RW	1	BCLE	Binary output mode clock loss detection enable

Detects loss of input MCLK in binary mode and will output 50% duty cycle.

5.6.4 LRCK double trigger protection

Table 48. LRCK double trigger protection

Bit	RW	RST	Name	Description
4	RW	1	LDTE	LRCLK double trigger protection enable

Actively prevents double trigger of LRCLK.

5.6.5 Auto EAPD on clock loss

Table 49. Auto EAPD on clock loss

Bit	RW	RST	Name	Description
5	RW	0	ECLE	Auto EAPD on clock loss

When active, will issue a power device power down signal (EAPD) on clock loss detection.

5.6.6 IC power down

Table 50. IC power down

Bit	RW	RST	Name	Description
7	RW	1	PWDN	IC power down: 0 - IC powerdown low-power condition 1 - IC normal operation

The PWDN register is used to place the IC in a low-power state. When PWDN is written as 0, the output will begin a soft-mute. After the mute condition is reached, EAPD will be asserted to power down the power-stage, then the master clock to all internal hardware except the I²C block will be gated. This places the IC in a very low power consumption state.

5.6.7 External amplifier power down

Table 51. External amplifier power down

Bit	RW	RST	Name	Description
7	RW	0	EAPD	External amplifier power down: 0: External power stage power down active 1: Normal operation

The EAPD register directly disables/enables the internal power circuitry.

When EAPD = 0, the internal power section is placed on a low-power state (disabled). This register will also control the DDX4B/EAPD output pin when OCFG = 10.

5.7 Volume control registers (addr 0x06 - 0x0A)

5.7.1 Mute/line output configuration register

D7	D6	D5	D4	D3	D2	D1	D0
LOC1	LOC0			C3M	C2M	C1M	MMUTE
0	0			0	0	0	0

Table 52. Line output configuration

LOC[1:0]	Line output configuration
00	Line output fixed - no volume, no EQ
01	Line output variable - CH3 volume effects line output, no EQ
10	Line output variable with EQ - CH3 volume effects line output

Line output is only active when OCFG = 00. In this case LOC will determine the line output configuration. The source of the line output is always the channel 1 and 2 inputs.

5.7.2 Master volume register

D7	D6	D5	D4	D3	D2	D1	D0
MV7	MV6	MV5	MV4	MV3	MV2	MV1	MV0
1	1	1	1	1	1	1	1

C1V7	C1V6	C1V5	C1V4	C1V3	C1V2	C1V1	C1V0
0	1	1	0	0	0	0	0

5.7.4 Channel 2 volume

D7	D6	D5	D4	D3	D2	D1	D0
C2V7	C2V6	C2V5	C2V4	C2V3	C2V2	C2V1	C2V0
0	1	1	0	0	0	0	0

5.7.5 Channel 3/line output volume

D7	D6	D5	D4	D3	D2	D1	D0
C3V7	C3V6	C3V5	C3V4	C3V3	C3V2	C3V1	C3V0
0	1	1	0	0	0	0	0

The volume structure of the STA559BWQS consists of individual volume registers for each channel and a master volume register that provides an offset to each channels volume setting. The individual channel volumes are adjustable in 0.5dB steps from +48 dB to -80 dB.

As an example if C3V = 00h or +48 dB and MV = 18h or -12 dB, then the total gain for channel 3 = +36 dB.

The master mute when set to 1 will mute all channels at once, whereas the individual channel mutes (CxM) will mute only that channel. Both the master mute and the channel mutes provide a “soft mute” with the volume ramping down to mute in 4096 samples from the maximum volume setting at the internal processing rate (approximately 96 kHz).

A “hard mute” can be obtained by commanding a value of 0xFF (255) to any channel volume register or the master volume register. When volume offsets are provided via the master volume register any channel that whose total volume is less than -80 dB will be muted.

All changes in volume take place at zero-crossings when ZCE = 1 (configuration register F) on a per channel basis as this creates the smoothest possible volume transitions. When ZCE = 0, volume updates will occur immediately.

Table 53. Master volume offset as a function of MV[7:0]

MV[7:0]	Volume offset from channel value
00000000 (0x00)	0 dB
00000001 (0x01)	-0.5 dB

1	0	0	0	0	0		

5.9.1 Tone control bypass

Tone control (bass/treble) can be bypassed on a per channel basis for channels 1 and 2.

CxTCB:

0 - Perform tone control on channel X - normal operation

1 - Bypass tone control on channel X

5.9.2 EQ bypass

EQ control can be bypassed on a per channel basis for channels 1 and 2. If EQ control is bypassed on a given channel the prescale and all filters (high-pass, biquads, de-emphasis, bass, treble in any combination) are bypassed for that channel.

CxEQBP:

0 - Perform EQ on channel X - normal operation

1 - Bypass EQ on channel X

5.9.3 Volume bypass

Each channel contains an individual channel volume bypass. If a particular channel has volume bypassed via the CxVBP = 1 register then only the channel volume setting for that particular channel affects the volume setting, the master volume setting will not affect that channel.

5.9.4 Binary output enable registers

Each individual channel output can be set to output a binary PWM stream. In this mode output A of a channel will be considered the positive output and output B is negative inverse.

CxBO:

0 - DDX tri-state output - normal operation

1 - Binary output.

5.9.5 Limiter select

Limiter selection can be made on a per-channel basis according to the channel limiter select bits.

Table 60. Channel limiter mapping as a function of CxLS bits

CxLS[1,0]	Channel limiter mapping
00	Channel has limiting disabled
01	Channel is mapped to limiter #1
10	Channel is mapped to limiter #2

5.9.6 Output mapping

Output mapping can be performed on a per channel basis according to the CxOM channel output mapping bits. Each input into the output configuration engine can receive data from any of the three processing channel outputs.

Table 61. Channel output mapping as a function of CxOM bits

CxOM[1,0]	Channel x output source from
00	Channel 1
01	Channel 2

0	1	1	0	1	0	0	1

The STA559BWQS includes 2 independent limiter blocks. The purpose of the limiters is to automatically reduce the dynamic range of a recording to prevent the outputs from clipping in anti-clipping mode or to actively reduce the dynamic range for a better listening environment such as a night-time listening mode which is often needed for DVDs. The two modes are selected via the DRC bit in configuration register F, bit 0 address 0x05. Each channel can be mapped to either limiter or not mapped, meaning that channel will clip when 0dBFS is exceeded. Each limiter will look at the present value of each channel that is mapped to it, select the maximum absolute value of all these channels, perform the limiting algorithm on that value, and then if needed adjust the gain of the mapped channels in unison.

The limiter attack thresholds are determined by the LxAT registers. It is recommended in anti-clipping mode to set this to 0dBFS, which corresponds to the maximum unclipped output power of a DDX amplifier. Since gain can be added digitally within STA559BWQS it is possible to exceed 0dBFS or any other LxAT setting, when this occurs, the limiter, when active, will automatically start reducing the gain. The rate at which the gain is reduced when the attack threshold is exceeded is dependent upon the attack rate register setting for that limiter. The gain reduction occurs on a peak-detect algorithm.

The release of limiter, when the gain is again increased, is dependent on a RMS-detect algorithm. The output of the volume/limiter block is passed through a RMS filter. The output of this filter is compared to the release threshold, determined by the release threshold register. When the RMS filter output falls below the release threshold, the gain is again increased at a rate dependent upon the release rate register. The gain can never be increased past it's set value and therefore the release will only occur if the limiter has already reduced the gain. The release threshold value can be used to set what is effectively a minimum dynamic range, this is helpful as over-limiting can reduce the dynamic range to virtually zero and cause program material to sound "lifeless".

In AC mode the attack and release thresholds are set relative to full-scale. In DRC mode the attack threshold is set relative to the maximum volume setting of the channels mapped to that limiter and the release threshold is set relative to the maximum volume setting plus the attack threshold.

Figure 32. Basic limiter and volume flow diagram.

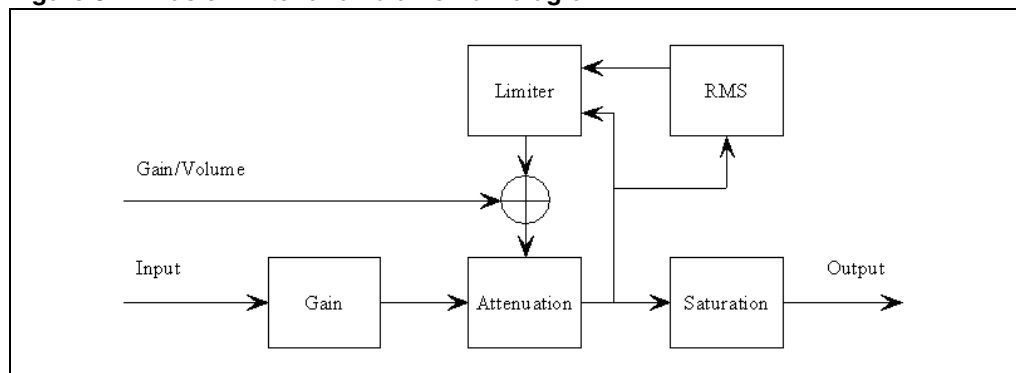

Table 63. Limiter attack rate as a function of LxA bits.

LxA[3:0]	Attack rate dB/ms	
0000	3.1584	Fast ↓ Slow

Coefficients for user-defined EQ, mixing, scaling, and bass management are handled internally in the STA559BWQS via RAM. Access to this RAM is available to the user via an I²C register interface. A collection of I²C registers are dedicated to this function. One contains a coefficient base address, five sets of three store the values of the 24-bit coefficients to be written or that were read, and one contains bits used to control the write/read of the coefficient(s) to/from RAM. The following are instructions for reading and writing coefficients.

Reading a coefficient from RAM

- write 6-bits of address to I²C register 0x16
- write 1 to R1 bit in I²C address 0x26
- read top 8-bits of coefficient in I²C address 0x17
- read middle 8-bits of coefficient in I²C address 0x18
- read bottom 8-bits of coefficient in I²C address 0x19.

Reading a set of coefficients from RAM

- write 6-bits of address to I²C register 0x16
- write 1 to RA bit in I²C address 0x26
- read top 8-bits of coefficient in I²C address 0x17
- read middle 8-bits of coefficient in I²C address 0x18
- read bottom 8-bits of coefficient in I²C address 0x19
- read top 8-bits of coefficient b2 in I²C address 0x1A
- read middle 8-bits of coefficient b2 in I²C address 0x1B
- read bottom 8-bits of coefficient b2 in I²C address 0x1C
- read top 8-bits of coefficient a1 in I²C address 0x1D
- read middle 8-bits of coefficient a1 in I²C address 0x1E
- read bottom 8-bits of coefficient a1 in I²C address 0x1F
- read top 8-bits of coefficient a2 in I²C address 0x20
- read middle 8-bits of coefficient a2 in I²C address 0x21
- read bottom 8-bits of coefficient a2 in I²C address 0x22
- read top 8-bits of coefficient b0 in I²C address 0x23
- read middle 8-bits of coefficient b0 in I²C address 0x24
- read bottom 8-bits of coefficient b0 in I²C address 0x25.

Writing a single coefficient to RAM

- write 6-bits of address to I²C register 0x16
- write top 8-bits of coefficient in I²C address 0x17
- write middle 8-bits of coefficient in I²C address 0x18
- write bottom 8-bits of coefficient in I²C address 0x19
- write 1 to W1 bit in I²C address 0x26.

Writing a set of coefficients to RAM

- write 6-bits of starting address to I²C register 0x16
- write top 8-bits of coefficient b1 in I²C address 0x17
- write middle 8-bits of coefficient b1 in I²C address 0x18
- write bottom 8-bits of coefficient b1 in I²C address 0x19
- write top 8-bits of coefficient b2 in I²C address 0x1A
- write middle 8-bits of coefficient b2 in I²C address 0x1B
- write bottom 8-bits of coefficient b2 in I²C address 0x1C
- write top 8-bits of coefficient a1 in I²C address 0x1D
- write middle 8-bits of coefficient a1 in I²C address 0x1E
- write bottom 8-bits of coefficient a1 in I²C address 0x1F
- write top 8-bits of coefficient a2 in I²C address 0x20
- write middle 8-bits of coefficient a2 in I²C address 0x21
- write bottom 8-bits of coefficient a2 in I²C address 0x22
- write top 8-bits of coefficient b0 in I²C address 0x23
- write middle 8-bits of coefficient b0 in I²C address 0x24
- write bottom 8-bits of coefficient b0 in I²C address 0x25
- write 1 to WA bit in I²C address 0x26.

The mechanism for writing a set of coefficients to RAM provides a method of updating the five coefficients corresponding to a given biquad (filter) simultaneously to avoid possible unpleasant acoustic side-effects. When using this technique, the 6-bit address would specify the address of the biquad b1 coefficient (for example, 0, 5, 10, 20, 35 decimal), and the STA559BWQS will generate the RAM addresses as offsets from this base value to write the complete set of coefficient data.

5.12.18 User-defined EQ

The STA559BWQS provides the ability to specify four EQ filters (biquads) per each of the two input channels. The biquads use the following equation:

$$Y[n] = 2(b_0/2)X[n] + 2(b_1/2)X[n-1] + b_2X[n-2] - 2(a_1/2)Y[n-1] - a_2Y[n-2]$$

$$= b_0X[n] + b_1X[n-1] + b_2X[n-2] - a_1Y[n-1] - a_2Y[n-2]$$

where Y[n] represents the output and X[n] represents the input. Multipliers are 24-bit signed fractional multipliers, with coefficient values in the range of 0x800000 (-1) to 0x7FFFFF (0.9999998808).

Coefficients stored in the user defined coefficient RAM are referenced in the following manner:

$$CxHy0 = b_1/2$$

$$CxHy1 = b_2$$

$$CxHy2 = -a_1/2$$

$$CxHy3 = -a_2$$

$$CxHy4 = b_0/2$$

where x represents the channel and the y the biquad number. For example C2H41 is the b_2 coefficient in the fourth biquad for channel 2.

Additionally, the STA559BWQS allows specification of a high-pass filter (processing channels 1 and 2) and a lo-pass filter (processing channel 3) to be used for bass-management crossover when the XO setting is 000 (user-defined). Both of these filters when defined by the user (rather than using the preset crossover filters) are 2nd order filters that use the biquad equation noted above. They are loaded into the C12H0-4 and C3Hy0-4 areas of RAM noted in the table below.

By default, all user-defined filters are pass-thru where all coefficients are set to 0, except the $b_0/2$ coefficient which is set to 0x400000 (representing 0.5)

5.12.19 Pre-scale

The STA559BWQS provides a multiplication for each input channel for the purpose of scaling the input prior to EQ. This pre-EQ scaling is accomplished by using a 24-bit signed fractional multiplier, with 0x800000 = -1 and 0x7FFFFFFF = 0.9999998808. The scale factor for this multiply is loaded into RAM using the same I²C registers as the biquad coefficients and the bass-management. All channels can use the channel 1 pre-scale factor by setting the Biquad link bit. By default, all pre-scale factors are set to 0x7FFFFFFF.

5.12.20 Post-scale

The STA559BWQS provides one additional multiplication after the last interpolation stage and the distortion compensation on each channel. This post-scaling is accomplished by using a 24-bit signed fractional multiplier, with 0x800000 = -1 and 0x7FFFFFFF = 0.9999998808. The scale factor for this multiply is loaded into RAM using the same I²C registers as the biquad coefficients and the bass-management. This post-scale factor can be used in conjunction with an ADC equipped micro-controller to perform power-supply error correction. All channels can use the channel 1 post-scale factor by setting the post-scale link bit. By default, all post-scale factors are set to 0x7FFFFFFF. When Line output is being utilized, channel 3 post-scale will affect both channels 3 and 4.

5.12.21 Over-current post-scale

The STA559BWQS provides a simple mechanism for reacting to over-current detection in the power-block. When the ocvrn input is asserted, the over-current post-scale value is used in place of the normal post-scale value to provide output attenuation on all channels. The default setting provides 3 dB of output attenuation when ocvrn is asserted. The amount of attenuation to be applied in this situation can be adjusted by modifying the Over-current Post-scale value. As with the normal post-scale, this scaling value is a 24-bit signed fractional multiplier, with 0x800000 = -1 and 0x7FFFFFFF = 0.9999998808. By default, the over-current post-scale factor is set to 0x5A9DF7. Once the over-current attenuation is applied, it remains until the device is reset.

Table 69. RAM block for biquads, mixing, scaling, and bass management

0	0	1	1	0	0	1	1

5.15 Fault detect recovery constant registers (addr 0x2B - 0x2C)

FDRC bits specify the 16-bit Fault Detect Recovery time delay. When FAULT is asserted, the TRISTATE output will be immediately asserted low and held low for the time period specified by this constant. A constant value of 0x0001 in this register is approximately 0.083 ms. The default value of 0x000C specifies approximately 0.1 ms.

D7	D6	D5	D4	D3	D2	D1	D0
PLLUL	FAULT	UVFAULT	OVFAULT	OCFAULT	OCWARN	TFAULT	TWARN

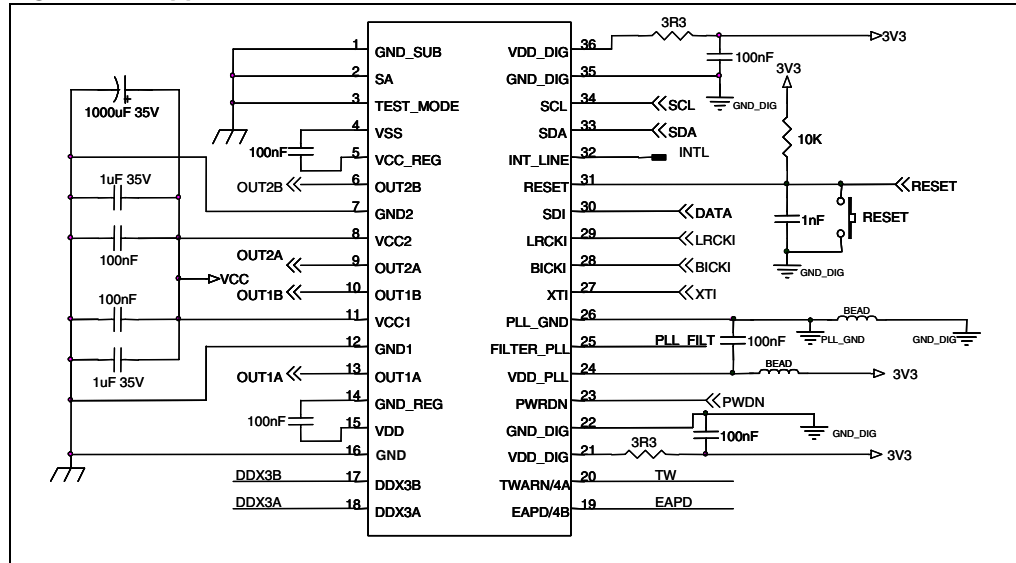

This read-only register provides fault and thermal-warning status information from the power control block.

6 Application

6.1 Application scheme for power supplies

Figure 33 below shows a circuit diagram of a typical application for STA559BWQS. Particular care has to be given to the layout of the PCB, especially the power supplies. The 3.3-Ω resistors on the digital supplies (VDD_DIG) have to be placed as close as possible to the device. This helps to prevent unwanted oscillation on the digital portion of the device due to inductive tracks of the PCB. This same rule also applies to all the decoupling capacitors in order to limit any kind of spikes on the supplies.

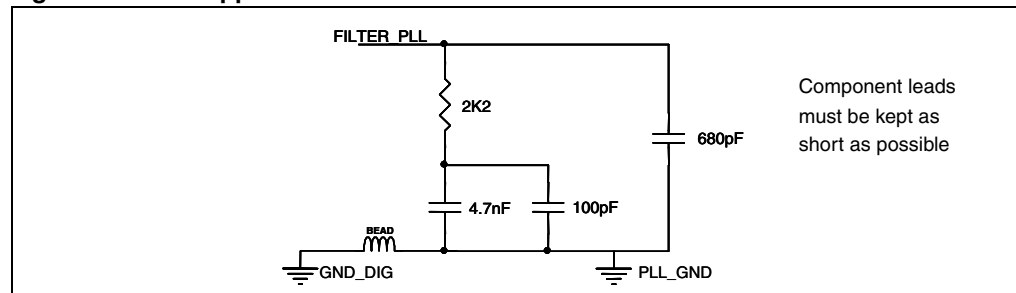

Figure 33. Application schematic

6.2 PLL filter schematic

It is recommended to use the below schematic and values in Figure 34 below for the PLL loop filter. In order to achieve the best performance from the device in general applications the filter ground (PLL_GND) must be connected as close as possible to the device pin PLL_GND. Concerning the component values, please take into account that the greater is the filter bandwidth, the less is the lock time but the higher is the PLL output jitter.

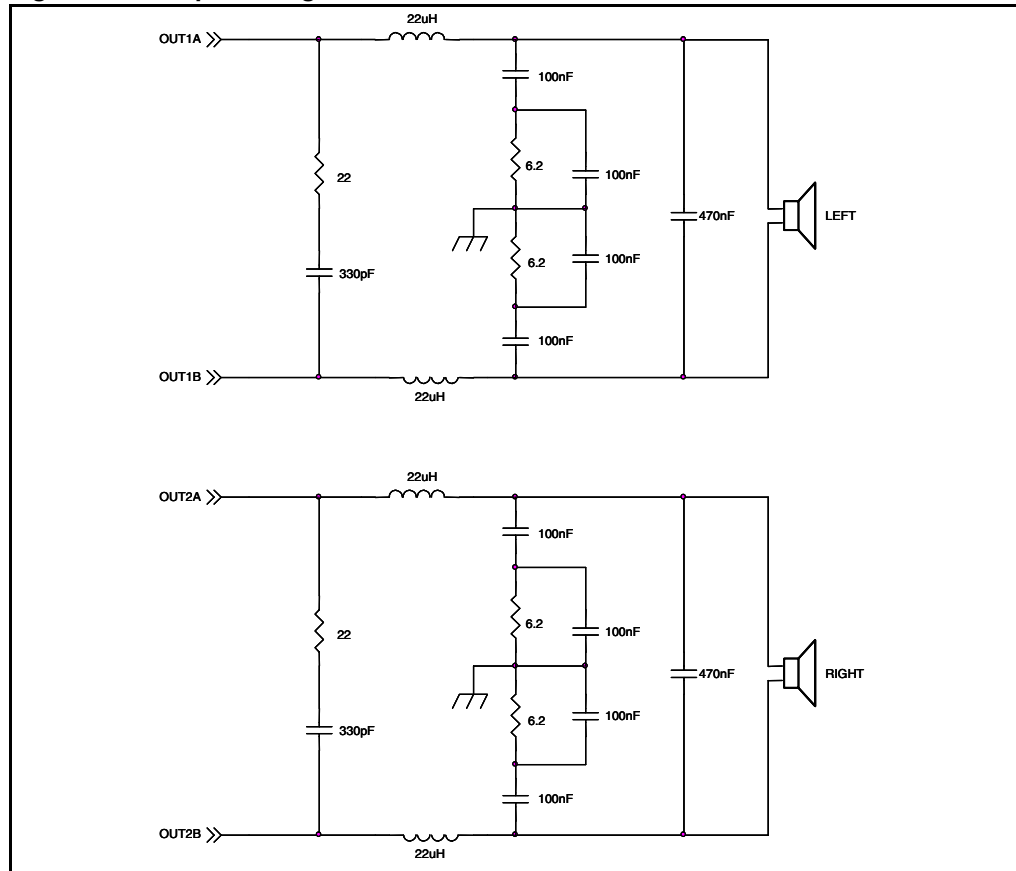

Figure 34. PLL application schematic

6.3 Typical output configuration

Figure 35 shows the typical output configuration used for BTL stereo mode. Please refer to the application note for other recommended output configuration schematics.

Figure 35. Output configuration for stereo BTL mode

7 Package thermal characteristics

Due to the high efficiency of the system the dissipated power is negligible, allowing the use of the STA559BWQS without heat sink but using only a small copper area on the PCB.

Using a double layer PCB the thermal resistance junction to ambient with two copper ground areas of $3 \times 3 \text{ cm}^2$ and with 16 via holes (see [Figure 36](#)) is 24° C/W in natural air convection.

The dissipated power within the device depends primarily on the supply voltage, load impedance and output modulation level.

The max estimated dissipated power for the STA559BWQS is:

$2 \times 3 \text{ W into } 4 \Omega \text{ at } 5 \text{ V}$	$P_d \text{ max} \sim 600\text{mW}$
$2 \times 0.7 \text{ W} + 1 \times 3 \text{ W into } 4 \Omega \text{ at } 5 \text{ V}$	$P_d \text{ max} < 500\text{mW}$
$2 \times 1.4 \text{ W} + 1 \times 6 \text{ W into } 2 \Omega \text{ at } 5 \text{ V}$	$P_d \text{ max} \sim 800\text{mW}$

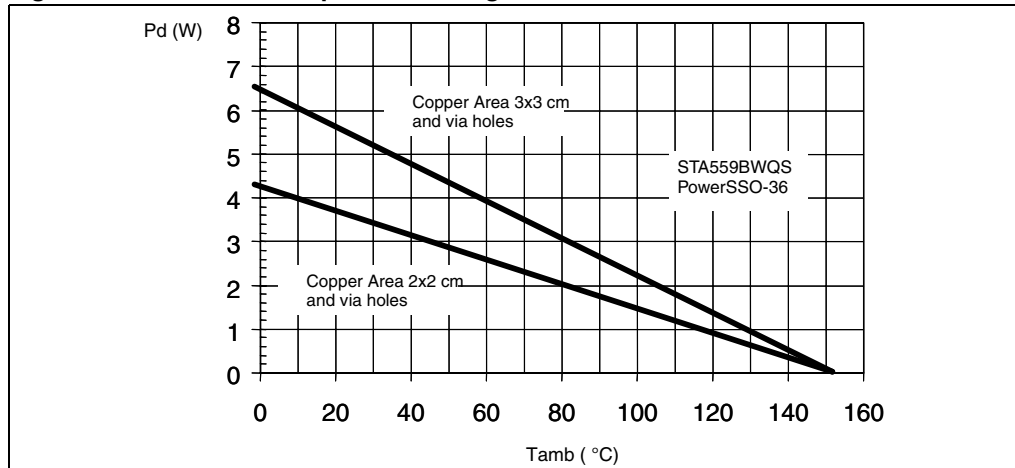

This gives, with the suggested board copper area, a max ΔT_j of only approximately 20° C for the worst case of the above mentioned applications. The safety margin before the thermal protection intervention ($T_j=150^\circ \text{ C}$) is thus ensured, also in severe environments where the ambient temperature exceeds 50° C .

Figure 36. Double layer PCB with copper ground area and with 16 via holes

[Figure 37](#) shows the power derating curves for the PowerSSO-36 package on a board with two different sizes of copper layers.

8 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
