## 5 V mixers/oscillators and synthesizers for cable TV and VCR 2-band tuners

## FEATURES

- Single-chip 5 V mixer/oscillator and synthesizer for cable TV and VCR tuners
- Synthesizer function compatible with existing TSA5526
- Universal bus protocol ( $1^{2} \mathrm{C}$-bus or 3 -wire bus)
- Bus protocol for 18 or 19-bit transmission (3-wire bus)
- Extra protocol for 27-bit transmission (test modes and features for 3-wire bus)
- Address + 4 data bytes transmission ( $\mathrm{I}^{2} \mathrm{C}$-bus 'write' mode)
- Address + 1 status byte ( ${ }^{2} \mathrm{C}$-bus 'read' mode)
- 4 independent $\mathrm{I}^{2} \mathrm{C}$-bus addresses.
- 1 PNP buffer for UHF band selection ( 25 mA )
- 3 PNP buffers for general purpose, e.g. 2 VHF sub-bands, FM sound trap ( 25 mA )
- 33 V tuning voltage output
- In-lock detector
- 5-step A/D converter (3 bits in $\mathrm{I}^{2} \mathrm{C}$-bus mode)
- 15-bit programmable divider
- Programmable reference divider ratio (512, 640 or 1024)
- Programmable charge pump current ( 60 or $280 \mu \mathrm{~A}$ )
- Programmable automatic charge pump current switch
- Varicap drive disable
- Mixer/oscillator function compatible with existing TDA5732
- Balanced mixer with a common emitter input for VHF (single input)
- Balanced mixer with a common base input for UHF (balanced input)
- 2-pin common emitter oscillator for VHF
- 4-pin common emitter oscillator for UHF
- IF preamplifier with asymmetrical $75 \Omega$ output impedance to drive a low-ohmic impedance (75 $\Omega$ )
- Low power
- Low radiation
- Small size
- The TDA6402A and TDA6403A differ from the TDA6402 and TDA6403 by the UHF port protocol in the I ${ }^{2} \mathrm{C}$-bus mode (see Tables 3 and 4).

## APPLICATIONS

- Cable tuners for TV and VCR (switched concept for VHF)
- Recommended RF bands for the USA: 55.25 to 133.25 MHz , 139.25 to 361.25 MHz and 367.25 to 801.25 MHz .

## GENERAL DESCRIPTION

The TDA6402, TDA6402A, TDA6403 and TDA6403A are programmable 2-band mixers/oscillators and synthesizers intended for VHF/UHF cable tuners (see Fig.1).
The devices include two double balanced mixers and two oscillators for the VHF and UHF band respectively, an IF amplifier and a PLL synthesizer. The VHF band can be split-up into two sub-bands using a proper oscillator application and a switchable inductor. Two pins are available between the mixer output and the IF amplifier input to enable IF filtering for improved signal handling. Four PNP ports are provided. Band selection is provided by using pin PUHF. When PUHF is 'ON', the UHF mixer-oscillator is active and the VHF band is switched off. When PUHF is 'OFF', the VHF mixer-oscillator is active and the UHF band is 'OFF'. PVHFL and PVHFH are used to select the VHF sub-bands. FMST is a general purpose port, that can be used to switch an FM sound trap. When it is used, the sum of the collector currents has to be limited to 30 mA .
The synthesizer consists of a divide-by-eight prescaler, a 15-bit programmable divider, a crystal oscillator and its programmable reference divider and a phase/frequency detector combined with a charge pump which drives the tuning amplifier, including 33 V output (V33) at pin VT.
Depending on the reference divider ratio (512, 640 or 1024), the phase comparator operates at 7.8125 kHz , 6.25 kHz or 3.90625 kHz with a 4 MHz crystal.

## 5 V mixers/oscillators and synthesizers for cable TV and VCR 2-band tuners

TDA6402; TDA6402A;
TDA6403; TDA6403A

The device can be controlled according to the $I^{2} \mathrm{C}$-bus format or 3 -wire bus format depending on the voltage applied to pin SW (see Table 2). In the 3-wire bus mode (SW = HIGH), pin LOCK/ADC is the LOCK output.
The LOCK output is LOW when the PLL loop is locked. In the $\mathrm{I}^{2} \mathrm{C}$-bus mode ( $\mathrm{SW}=\mathrm{LOW}$ ), the lock detector bit FL is set to logic 1 when the loop is locked and is read on the SDA line (Status Byte; SB) during a READ operation in ${ }^{2}$ ²-bus mode only. The Analog-to-Digital Converter (ADC) input is available on pin LOCK/ADC for digital AFC control in the $I^{2} \mathrm{C}$-bus mode only. The ADC code is read during a READ operation on the $\mathrm{I}^{2} \mathrm{C}$-bus (see Table 11). In test mode, pin LOCK/ADC is used as a TEST output for $f_{\text {REF }}$ and $1 / 2 f_{\text {DIV }}$, in both $I^{2} \mathrm{C}$-bus mode and 3 -wire bus mode (see Table 7).

When the automatic charge pump current switch mode is activated and when the loop is phase-locked, the charge pump current value is automatically switched to LOW. This action is taken to improve the carrier-to-noise ratio.
The status of this feature can be read in the ACPS flag during a READ operation on the $\mathrm{I}^{2} \mathrm{C}$-bus (see Table 9).

## $I^{2} \mathrm{C}$-bus mode (SW = GND)

Five serial bytes (including address byte) are required to address the device, select the VCO frequency, program the four ports, set the charge pump current and set the reference divider ratio. The device has four independent $\mathrm{I}^{2} \mathrm{C}$-bus addresses which can be selected by applying a specific voltage on input CE (see Table 6).

## 3-wire bus mode (SW = OPEN or VCC)

Data is transmitted to the devices during a HIGH-level on input CE (enable line). The device is compatible with 18 -bit and 19-bit data formats, as shown in Figs 4 and 5 . The first four bits are used to program the PNP ports and the remaining bits control the programmable divider. A 27 -bit data format may also be used to set the charge pump current, the reference divider ratio and for test purposes (see Fig.6).
It is not allowed to address the devices with words whose length is different from 18,19 or 27 bits.

Table 1 Data word length for 3-wire bus

| TYPE NUMBER | DATA WORD | REFERENCE DIVIDER ${ }^{(1)}$ | FREQUENCY STEP |
| :--- | :--- | :--- | :--- |
| TDA6402; TDA6402A; TDA6403; TDA6403A | 18-bit | 512 | 62.50 kHz |
| TDA6402; TDA6402A; TDA6403; TDA6403A | 19-bit | 1024 | 31.25 kHz |
| TDA6402; TDA6402A; TDA6403; TDA6403A | 27 -bit | programmable | programmable |

## Note

1. The selection of the reference divider is given by an automatic identification of the data word length. When the 27-bit format is used, the reference divider is controlled by RSA and RSB bits (see Table 8). More details are given in Chapter "PLL functional description", Section " 3 -wire bus mode (SW = OPEN or $\mathrm{V}_{\mathrm{CC}}$ )".

## PLL FUNCTIONAL DESCRIPTION

The device is controlled via the $\mathrm{I}^{2} \mathrm{C}$-bus or the 3 -wire bus, depending on the voltage applied on the SW input. A HIGH-level on the SW input enables the 3-wire bus; CE/AS, DA and CL inputs are used as enable (CE), data

Fig. 3 Pin configuration for TDA6403 and TDA6403A.
and clock inputs respectively. A LOW-level on SW input enables the $\mathrm{I}^{2} \mathrm{C}$-bus; the $\mathrm{CE} / \mathrm{AS}, \mathrm{DA}$ and CL inputs are used as address selection (AS), SDA and SCL input respectively (see Table 2).

TDA6402; TDA6402A;
TDA6403; TDA6403A

## $I^{2}$ C-bus mode (SW = GND)

Write mode; R/W = 0 (see Tables 3 and 4)
Data bytes can be sent to the device after the address transmission (first byte). Four data bytes are needed to fully program the device. The bus transceiver has an auto-increment facility which permits the programming of the device within one single transmission
(address + 4 data bytes).
The device can also be partially programmed providing that the first data byte following the address is divider byte 1 (DB1) or control byte (CB). The bits in the data bytes are defined in Tables 3 and 4. The first bit of the first data byte transmitted indicates whether frequency data (first bit $=0$ ) or control and band-switch data (first bit = 1) will follow. Until an $\mathrm{I}^{2} \mathrm{C}$-bus STOP command is sent by the
controller, additional data bytes can be entered without the need to re-address the device. The frequency register is loaded after the 8th clock pulse of the second divider byte (DB2), the control register is loaded after the 8th clock pulse of the control byte (CB) and the band-switch register is loaded after the 8th clock pulse of the band switch byte (BB).

## ${ }^{1}$ ²C-bus address selection

The module address contains programmable address bits (MA1 and MA0) which offer the possibility of having several synthesizers (up to 4) in one system by applying a specific voltage on the CE input. The relationship between MA1 and MA0 and the input voltage applied to the CE input is given in Table 6.

| 1 | 1 | 512 | 7.8125 |

## Note

1. $X=$ don't care .

Read mode; R/W = 1 (see Table 9)
Data can be read from the device by setting the R/W bit to logic 1. After the slave address has been recognized, the device generates an acknowledge pulse and the first data byte (status byte) is transferred on the SDA line (MSB first). Data is valid on the SDA line during a HIGH-level of the SCL clock signal. A second data byte can be read from the device if the microcontroller generates an acknowledge on the SDA line (master acknowledge).
End of transmission will occur if no master acknowledge occurs. The device will then release the data line to allow the microcontroller to generate a STOP condition.
The POR flag is set to logic 1 at power-on. The flag is reset when an end-of-data is detected by the device (end of a

READ sequence). Control of the loop is made possible with the in-lock flag FL which indicates when the loop is locked (FL = 1).

The automatic charge pump switch flag (ACPS) is LOW when the automatic charge pump switch mode is 'ON' and the loop is locked. In other conditions, ACPS $=1$.
When ACPS $=0$, the charge pump current is forced to the LOW value.
A built-in ADC is available on LOCK/ADC pin $\left(I^{2} \mathrm{C}\right.$-bus mode only). This converter can be used to apply AFC information to the microcontroller from the IF section of the television. The relationship between the bits A2, A1 and A0 is given in Table 11.

| Divider byte 2 | DB2 | X | X | X | X | X | X | X | X |
| Control byte | CB | 1 | 1 | 0 | 0 | 1 | X | 1 | 1 |
| Band switch byte | BB | X | X | X | X | 0 | 0 | 0 | 0 |

The power-on detection threshold voltage $\mathrm{V}_{\mathrm{POR}}$ is set to $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ at room temperature. Below this threshold, the device is reset to the power-on state.

At power-on state, the charge pump current is set to $280 \mu \mathrm{~A}$, the tuning voltage output is disabled, the test bits T2, T1 and T0 are set to ' 001 ' (automatic charge pump switch 'ON') and RSB is set to logic 1.
PUHF is 'OFF', which means that the UHF oscillator and the UHF mixer are switched off. Consequently, the VHF oscillator and the VHF mixer are switched on. PVHFL and PVHFH are 'OFF', which means that the VHF tank circuit is working in the VHF I sub-band. The tuning amplifier is switched off until the first transmission. In that case, the tank circuit in VHF I is supplied with the maximum tuning voltage. The oscillator is therefore working at the end of the VHF I sub-band.

## 3-wire bus mode (SW = OPEN or $\mathrm{V}_{\mathrm{Cc}}$ )

During a HIGH-level on the CE input (enable line), the data is clocked into the data register at the HIGH-to-LOW transition of the clock. The first four bits control the PNP ports and are loaded into the internal band switch register on the 5th rising edge of the clock pulse. The frequency
bits are loaded into the frequency register at the HIGH-to-LOW transition of the chip enable line when an 18-bit or 19-bit data word is transmitted (see Figs 4 and 5).

When a 27-bit data word is transmitted, the frequency bits are loaded into the frequency register on the 20th rising edge of the clock pulse and the control bits at the HIGH-to-LOW transition of the chip enable line (see Fig.6). In this mode, the reference divider is given by the RSA and RSB bits (see Table 8). The test bits T2, T1 and T0, the charge pump bit CP, the ratio select bit RSB and the OS bit can only be selected or changed with a 27-bit transmission. They remain programmed if an 18-bit or 19-bit transmission occurs. Only RSA is controlled by the transmission length when the 18-bit or 19-bit format is used. When an 18-bit data word is transmitted, the most significant bit of the divider N14 is internally set to logic 0 and the RSA bit is set to logic 1 . When a 19-bit data word is transmitted, the RSA bit is set to logic 0 .

A data word of less than 18 bits will not affect the frequency register of the device. The definition of the bits is unchanged compared to $I^{2} \mathrm{C}$-bus mode.
It is not allowed to address the devices with words whose length is different from 18, 19 or 27 bits.

## 5 V mixers/oscillators and synthesizers for cable TV and VCR 2-band tuners

TDA6402; TDA6402A;
TDA6403; TDA6403A

## Power-on reset

The power-on detection threshold voltage $\mathrm{V}_{\mathrm{POR}}$ is set to $\mathrm{V}_{\mathrm{cc}}=2 \mathrm{~V}$ at room temperature. Below this threshold, the device is reset to the power-on state.

At power-on state, the charge pump current is set to $280 \mu \mathrm{~A}$, the tuning voltage output is disabled, the test bits T2, T1 and T0 are set to '001' (automatic charge pump switch 'ON') and RSB is set to logic 1.

PUHF is 'OFF', which means that the UHF oscillator and the UHF mixer are switched off. Consequently, the VHF oscillator and the VHF mixer are switched on. PVHFL and

PVHFH are 'OFF', which means that the VHF tank circuit is working in the VHF I sub-band. The tuning amplifier is switched off until the first transmission. In that case, the tank circuit in VHF I is supplied with the maximum tuning voltage. The oscillator is therefore working at the end of the VHF I sub-band.

If the first sequence transmitted to the device has 18 or 19 bits, the reference divider ratio is set to 512 or 1024 , depending on the sequence length.
If the sequence has 27 bits, the reference divider ratio is fixed by RSA and RSB bits (see Table 8).

## Notes

1. The RF frequency range is defined by the oscillator frequency range and the intermediate frequency (IF).
2. This is the level of the RF signal ( $100 \%$ amplitude modulated with 11.89 kHz ) that causes a 750 Hz frequency deviation on the oscillator signal; it produces sidebands 30 dB below the level of the oscillator signal.
3. Limits are related to the tank circuits used in Fig.19; frequency bands may be adjusted by the choice of external components.
4. The frequency shift is defined as a change in oscillator frequency when the supply voltage varies from $\mathrm{V}_{\mathrm{CC}}=5$ to $4.75 \mathrm{~V}(4.5 \mathrm{~V})$ or from $\mathrm{V}_{\mathrm{CC}}=5$ to $5.25 \mathrm{~V}(5.5 \mathrm{~V})$. The oscillator is free running during this measurement.

## 5 V mixers/oscillators and synthesizers for cable TV and VCR 2-band tuners

TDA6402; TDA6402A;
TDA6403; TDA6403A
5. The frequency drift is defined as a change in oscillator frequency when the ambient temperature varies from $\mathrm{T}_{\mathrm{amb}}=25$ to $50^{\circ} \mathrm{C}$ or from $\mathrm{T}_{\mathrm{amb}}=25$ to $0^{\circ} \mathrm{C}$. The oscillator is free running during this measurement. The VHF drift value can be improved by adding a $10 \mathrm{k} \Omega$ resistor between the VHFOSCOC pin and the $\mathrm{V}_{\mathrm{Cc}}$. In that case the typical VHF drift value can be reduced to 900 kHz .
6. Switch-on drift is defined as the change in oscillator frequency between 5 s and 15 min after switch on. The oscillator is free running during this measurement.
7. The ripple susceptibility is measured for a 500 kHz ripple at the IF output using the measurement circuit of Fig.19; the level of the ripple signal is increased until a difference of 53.5 dB occurs between the IF carrier fixed at $100 \mathrm{~dB} \mu \mathrm{~V}$ and the sideband components.
8. This is the level of divider interferences close to the IF frequency. For example channel C: fosc $=179 \mathrm{MHz}$, $1 / 4 \mathrm{fosc}=44.75 \mathrm{MHz}$. Divider interference is measured with the Philips 37185 demonstration board in accordance with Fig.19. All ground pins are connected to a single ground plane under the IC. The VHFIN input must be left open (i.e. not connected to any load or cable); The UHFIN1 and UHFIN2 inputs are connected to a hybrid. The measured levels of divider interference are influenced by layout, grounding and port decoupling. The measurement results could vary by as much as 10 dB with respect to the specification.
9. Crystal oscillator interference means the 4 MHz sidebands caused by the crystal oscillator. The rejection has to be greater than 60 dB for an IF output signal of $100 \mathrm{~dB} \mu \mathrm{~V}$.
10. The reference frequency rejection is the level of reference frequency sidebands related to the sound sub-carrier. The rejection has to be greater than 50 dB for an IF output signal of $100 \mathrm{~dB} \mu \mathrm{~V}$.
11. Channel 6 beat is the interfering product of $f_{\text {RFpix }}+f_{\text {RFsnd }}-f_{\text {OSC }}$ of channel 6 at 42 MHz .
12. Channel $A-5$ beat is the interfering product of $f_{\text {RFpix }}, f_{I F}$ and $f_{\text {OSC }}$ of channel $A-4 ; f_{B E A T}=45.5 \mathrm{MHz}$. The possible mechanisms are: $\mathrm{f}_{\mathrm{OSC}}-2 \times \mathrm{f}_{\mathrm{IF}}$ or $2 \times \mathrm{f}_{\mathrm{RF} \text { pix }}-\mathrm{f}_{\mathrm{Osc}}$. For the measurement $\mathrm{V}_{\mathrm{RF}}=80 \mathrm{~dB} \mu \mathrm{~V}$.

## Tuning amplifier

The tuning amplifier is capable of driving the varicap voltage without an external transistor. The tuning voltage output must be connected to an external load of $27 \mathrm{k} \Omega$ which is connected to the tuning voltage supply rail. The loop filter design depends on the oscillator characteristics and the selected reference frequency.

## Crystal oscillator

The crystal oscillator uses a 4 MHz crystal connected in series with an 18 pF capacitor thereby operating in the series resonance mode. Connecting the oscillator to the supply voltage is preferred, but it can also be connected to ground.

Examples of $\mathrm{I}^{2} \mathrm{C}$-bus sequences ( $\mathrm{SW}=\mathrm{V}_{\mathrm{Cc}}$ ) for TDA6402 and TDA6403

Tables 20 to 24 show the various sequences where:
$\mathrm{f}_{\mathrm{OSC}}=100 \mathrm{MHz}$
PVHFL = 'ON' to switch on VHF I
FMST is 'ON' to switch on an FM sound trap
$I_{C P}=280 \mu \mathrm{~A}$
$N=512$
$\mathrm{f}_{\mathrm{XTAL}}=4 \mathrm{MHz}$
S = START
A = acknowledge
$P=S T O P$.
For the complete sequence see Table 20 (sequence 1) or Table 21 (sequence 2).

## SOLDERING

## Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

## Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to $250^{\circ} \mathrm{C}$. The top-surface temperature of the packages should preferable be kept below $230^{\circ} \mathrm{C}$.

## Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.
To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
- larger than or equal to 1.27 mm , the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;
- smaller than 1.27 mm , the footprint longitudinal axis must be parallel to the transport direction of the printed-circuit board.
The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a $45^{\circ}$ angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.
During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.
Typical dwell time is 4 seconds at $250^{\circ} \mathrm{C}$. A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

## Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage ( 24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to $300^{\circ} \mathrm{C}$.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and $320^{\circ} \mathrm{C}$.

|  | WAVE | REFLOW ${ }^{(1)}$ |
| BGA, LFBGA, SQFP, TFBGA <br> HBCC, HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, SMS <br> PLCC ${ }^{(3)}$, SO, SOJ <br> LQFP, QFP, TQFP <br> SSOP, TSSOP, VSO | not suitable <br> not suitable ${ }^{(2)}$ <br> suitable <br> not recommended ${ }^{(3)(4)}$ <br> not recommended ${ }^{(5)}$ | suitable <br> suitable <br> suitable <br> suitable <br> suitable |

## Notes

1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
3. If wave soldering is considered, then the package must be placed at a $45^{\circ}$ angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm .
5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm .

## 5 V mixers/oscillators and synthesizers for cable TV and VCR 2-band tuners

TDA6402; TDA6402A;
TDA6403; TDA6403A

## DEFINITIONS

| Data sheet status |  |
| :--- | :--- |
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| Limiting values |  |
| Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or <br> more of the e limiting values may cause permanent damage to the device. These are stress ratings only and operation <br> of the device at these or at any other conditions above those given in the Characteristics sections of the specification <br> is not implied. Exposure to limiting values for extended periods may affect device reliability. |  |
| Application information | Where application information is given, it is advisory and does not form part of the specification. |

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

## PURCHASE OF PHILIPS ${ }^{2}$ ² COMPONENTS

Purchase of Philips $I^{2} \mathrm{C}$ components conveys a license under the Philips' $I^{2} \mathrm{C}$ patent to use the components in the ${ }^{2} \mathrm{C}$ system provided the system conforms to the $\mathrm{I}^{2} \mathrm{C}$ specification defined by Philips. This specification can be ordered using the code 939839340011.
