

FEATURES

- RF frequency: 700 MHz to 2800 MHz continuous
- LO frequency: 250 MHz to 2800 MHz, high-side or low-side inject
- IF range: 30 MHz to 450 MHz
- Power conversion gain of 7.5 dB at 1900 MHz
- SSB noise figure of 10.7 dB at 1900 MHz
- Input IP₃ of 27.5 dBm at 1900 MHz
- Input P_{1dB} of 12.7 dBm at 1900 MHz
- Typical LO drive of 0 dBm
- Single-ended, 50 Ω RF port
- Single-ended or balanced LO input port
- Single-supply operation: 3.6 V to 5.0 V
- Serial port interface control on all functions
- Exposed paddle 5 mm × 5 mm, 32-lead LFCSP package

APPLICATIONS

- Multiband/multistandard cellular base station receivers
- Wideband radio link diversity downconverters
- Multimode cellular extenders and broadband receivers

GENERAL DESCRIPTION

The ADL5811 uses revolutionary new broadband, square wave limiting, local oscillator (LO) amplifiers to achieve an unprecedented radio frequency (RF) bandwidth of 700 MHz to 2800 MHz. Unlike conventional narrow-band sine wave LO amplifier solutions, this permits the LO to be applied either above or below the RF input over an extremely wide bandwidth. Because energy storage elements are not used, the dc current consumption also decreases with decreasing LO frequency.

The ADL5811 uses highly linear, doubly balanced, passive mixer cores along with integrated RF and LO balancing circuits to allow single-ended operation. The ADL5811 incorporates programmable RF baluns, allowing optimal performance over a 700 MHz to 2800 MHz RF input frequency. The balanced passive mixer arrangement provides outstanding LO-to-RF and LO-to-IF leakages, excellent RF-to-IF isolation, and excellent intermodulation performance over the full RF bandwidth.

The balanced mixer cores also provide extremely high input linearity, allowing the device to be used in demanding

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

wideband applications where in-band blocking signals may otherwise result in the degradation of dynamic range. Blocker noise figure performance is comparable to narrow-band passive mixer designs. High linearity IF buffer amplifiers follow the passive mixer cores, yielding typical power conversion gains of 7.5 dB, and can be used with a wide range of output impedances. For low voltage applications, the ADL5811 is capable of operation at voltages down to 3.6 V with substantially reduced current. Two logic bits are provided to power down (<1.5 mA) the circuit when desired.

All features of the ADL5811 are controlled via a 3-wire serial port interface, resulting in optimum performance and minimum external components.

The ADL5811 is fabricated using a BiCMOS high performance IC process. The device is available in a 32-lead, 5mm × 5mm, LFCSP package and operates over a -40°C to +85°C temperature range. An evaluation board is also available.

ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Supply Voltage, V_{POS}	5.5 V
CLK, DATA, LE	5.5 V
IF Output Bias	6.0 V
RF Input Power	20 dBm
LO Input Power	13 dBm
Internal Power Dissipation	1.1 W
θ_{JA} (Exposed Paddle Soldered Down)	25°C/W
Maximum Junction Temperature	150°C
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES**
1. NC = NO CONNECT. CAN BE GROUNDED.
 2. EXPOSED PAD MUST BE CONNECTED TO GROUND.

09912-003

Figure 3. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 3, 5 to 8, 22 to 24, 27, 30	NC	No Connect. Can be grounded.
2	RFCT	RF Balun Center Tap (AC Ground).
4	RFIN	RF Input. Should be ac-coupled.
9, 11, 13, 15	VLO4, VLO3, VLO2, VLO1	Positive Supply Voltages for LO Amplifier.
10, 12, 14, 16, 25	COMM	Ground.
17, 18, 19	CLK, DATA, LE	Serial Port Interface Control.
20	LOIN	Ground Return for LO Input.
21	LOIP	LO Input. Should be ac-coupled.
26	IFGD	Supply Return for IF Amplifier. Must be grounded.
28, 29	IFOP, IFON	IF Differential Open-Collector Outputs. Should be pulled up to V_{CC} using external inductors.
31	IFGM	IF Amplifier Bias Control.
32	VPIF	Supply Voltage for IF Amplifier.
	EPAD	Exposed pad must be connected to ground.

TYPICAL PERFORMANCE CHARACTERISTICS

$V_S = 5\text{ V}$, $T_A = 25^\circ\text{C}$, $f_{RF} = 1900\text{ MHz}$, $f_{LO} = 1697\text{ MHz}$, RF power = -10 dBm , LO power = 0 dBm , $R_1 = 910\ \Omega$, $Z_O = 50\ \Omega$, optimum SPI settings, unless otherwise noted.

SPURIOUS PERFORMANCE

$(N \times f_{RF}) - (M \times f_{LO})$ spur measurements were made using the standard evaluation board. Mixer spurious products are measured in dBc from the IF output power level. Data was measured only for frequencies less than 6 GHz. Typical noise floor of the measurement system = -100 dBm.

5 V Performance

$V_s = 5\text{ V}$, $T_A = 25^\circ\text{C}$, RF power = -10 dBm, LO power = 0 dBm, $R_1 = 910\ \Omega$, $Z_o = 50\ \Omega$, optimum SPI settings, unless otherwise noted.

LO SUBSYSTEM

The LO amplifier is designed to provide a large signal level to the mixer to obtain optimum intermodulation and compression performance. The resulting LO amplifier provides very high performance over a wide range of LO input frequencies.

The ideal waveshape for switching the passive mixer is a square wave at the LO frequency to cause the mixer to switch through its resistive region (from on to off and off to on) as rapidly as possible. While it has always been possible to generate such a square wave, the amount of dc current required to generate a large amplitude square wave at high frequencies has made it impractical to create such a mixer. Novel circuitry within the [ADL5811](#) permits the generation of a near-square wave output at frequencies of up to 2800 MHz with dc current that compares favorably with that employed by narrow-band passive mixers.

The input stages of the LO amplifier provide common-mode rejection, permitting the LO input to be driven either single ended or balanced. For a single-ended input, either LOIP or LOIN can be grounded. It is desirable to dc block the LO inputs to avoid damaging the part by the accidental application of a large dc voltage to the part. In addition, the LO inputs are internally dc blocked.

Because the LO amplifier is inherently wideband, the [ADL5811](#) can be driven with either high-side or low-side LO by simply setting the optimum RF balun and LPF inputs to the SPI.

The LO amplifier converts a variable level, single or balanced input signal (–6 dBm to +10 dBm) to a hard voltage limited, balanced signal internally to drive the mixer. Excellent performance can be

obtained with a 0 dBm input level; however, the circuit continues to function at considerably lower levels of LO input power.

The performance of this amplifier is critical in achieving a high intercept passive mixer without degrading the noise floor of the system. This is a critical requirement in an interferer rich environment, such as cellular infrastructure, where blocking interferers can limit mixer performance. Blocking dynamic range can benefit from a higher level of LO drive, which pushes the LO amplifier stages harder into compression and causes them to switch harder and to limit the small signal gain of the chain. Both of these conditions are beneficial to low noise figure under blocking. NF under blocking can be improved several decibels for LO input power levels above 0 dBm.

The LO amplifier topology inherently minimizes the dc current based on the LO operating voltage and the LO operating frequency. It is permissible to reduce the LO supply voltage down as low as 3.6 V, which drops the dc current rapidly. The mixer dynamic range varies accordingly with the LO supply voltage. No external biasing resistor is required for optimizing the LO amplifier.

In addition, the [ADL5811](#) has a power-down mode that can be used with any supply voltage applied to the part.

All of the SPI inputs are designed to work with any logic family that provides a Logic 0 input level of less than 0.4 V and a Logic 1 input level that exceeds 1.4 V.

All pins, including the RF pins, are ESD protected and have been tested up to a level of 2000 V HBM and 1250 V CDM.

LOW-PASS FILTER PROGRAMMING

The [ADL5811](#) allows programmability for the low-pass filter terminating the mixer output. This filter helps to block sum term mixing products at the expense of some noise figure and gain and can significantly increase input IP3. The [ADL5811](#) defaults the LPF setting to 0. Power conversion gain, input IP3, NF, and input P1dB can be optimized, as shown in Figure 48 to Figure 51.

RF BALUN PROGRAMMING

The [ADL5811](#) allows programmability for the RF balun by allowing capacitance to be switched into both the input and the output, which allows the balun to be tuned to cover the entire frequency band (700 MHz to 2800 MHz). Under most circumstances, the input and output can be tuned together though sometimes it may be advantageous for matching reasons to tune them separately. The [ADL5811](#) defaults the RFB setting to 0. Power conversion gain, input IP3, NF, and input P1dB can be optimized, as shown in Figure 44 to Figure 47.

REGISTER STRUCTURE

Figure 60 illustrates the register map of the ADL5811. The ADL5811 only uses Register 5. Because of this, set all of the control bits to 5. When set to 0, the ENBL bit, DB7, enables the part. By setting this bit to 1, the mixer is powered down. The RFB IN CAP DAC and RFB OUT CAP DAC bits are used to tune the RF balun. In most cases, they are tuned together with the higher settings, 7, tuning for the low frequencies, and with the lower settings, 0, tuning for the high frequencies. There are times where it becomes advantageous to tune the input and output of the RF balun separately and that ability is provided.

The LPF bits control the low-pass filter settings at the IF output. The ability to tune the low-pass filter allows some trade-off between gain, noise figure, and input IP3 with higher settings, 7, providing higher input IP3 at the cost of some gain and noise figure, and lower settings, 0, providing higher gain and lower NF at the cost of lower input IP3. The VGS bits control the VGS settings of the mixer core and allow further tuning of the device.

Table 11 lists the optimum settings characterized for each frequency band. All register bits default to 0.

EVALUATION BOARD

An evaluation board is available for the [ADL5811](#). The standard evaluation board schematic is presented in Figure 61. The USB interface circuitry schematic is presented in Figure 64. The evaluation board layout is shown in Figure 62 and Figure 63.

The evaluation board is fabricated using Rogers® 3003 material. Table 12 details the configuration for the mixer characterization. The evaluation board software is available on www.analog.com.

Figure 61. Evaluation Board Schematic

Table 12. Evaluation Board Configuration

Components	Description	Default Conditions
C1, C2, C8, C18, C19, C20, C23	Power supply decoupling. Nominal supply decoupling consists of a 0.1 μF capacitor to ground in parallel with a 10 pF capacitor to ground positioned as close to the device as possible.	C1, C2 = 0.1 μF (size 0402), C8, C18, C19, C20, C23 = 10 pF (size 0402)
C6, C7, RFIN	RF input interface. The input channel is ac-coupled through C6. C7 provides bypassing for the center tap of the RF input balun.	C6 = 22 pF (size 0402), C7 = 100 pF (size 0402)
C3, C4, C5, L1, L2, R20, R21, T1, IFOP, IFON	IF output interface. The open-collector IF output interfaces are biased through pull-up choke inductors, L1 and L2. T1 is a 4:1 impedance transformer used to provide a single-ended IF output interface, with C5 providing center-tap bypassing. Remove R21 for balanced output operation.	C3, C4, C5 = 120 pF (size 0402), L1, L2 = 470 nH (size 0603), R20 = open, R21 = 0 Ω (size 0402), T1 = TC4-1W+ (Mini-Circuits®)
C17, LOIP	LO interface. C17 provides ac coupling for the LOIP local oscillator input.	C17 = 22 pF (size 0402)
R1	Bias control. R1 sets the bias point for the internal IF amplifier.	R1 = 910 Ω (size 0402)
