

### 650MHz, Gain of 5, Low Noise Amplifiers

The EL5134, EL5135, EL5234, and EL5235 are ultra-low voltage noise, high speed voltage feedback amplifiers that are ideal for applications requiring low voltage noise, including communications and imaging. These devices offer extremely low power consumption for exceptional noise performance. Stable at gains as low as 5, these devices offer 100mA of drive performance. Not only do these devices find perfect application in high gain applications, they maintain their performance down to lower gain settings.

These amplifiers are available in small package options (SOT-23) as well as the MSOP and the industry-standard SO packages. All parts are specified for operation over the -40°C to +85°C temperature range.

### Features

- 650MHz -3dB bandwidth
- $A_v = +5$  stable
- Ultra low noise  $1.5\text{nV}/\sqrt{\text{Hz}}$  and  $0.9\text{pA}/\sqrt{\text{Hz}}$
- 450V/ $\mu\text{s}$  slew rate
- Low supply current = 6.7mA per amplifier
- Single supplies from 5V to 12V
- Dual supplies from  $\pm 2.5\text{V}$  to  $\pm 5\text{V}$
- Fast disable on the EL5134 and EL5234
- Duals EL5234 and EL5235
- Low cost
- Pb-free plus anneal available (RoHS compliant)

### Applications

- Imaging
- Instrumentation
- Communications devices

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

**Product Description**

The EL5134, EL5135, EL5234 and EL5235 are voltage feedback operational amplifiers designed for communication and imaging applications requiring very low voltage and current noise. They also feature low distortion while drawing moderately low supply current and is built on Intersil's proprietary high-speed complementary bipolar process. The EL5134, EL5135, EL5234 and EL5235 use a classical voltage-feedback topology which allows them to be used in a variety of applications where current-feedback amplifiers are

not appropriate because of restrictions placed upon the feedback element used with the amplifier.

**Gain-Bandwidth Product and the -3dB Bandwidth**

The EL5134, EL5135, EL5234 and EL5235 have a gain-bandwidth product of 1500MHz while using only 6.7mA of supply current per amplifier. For gains greater than 5 their closed-loop -3dB bandwidth is approximately equal to the gain-bandwidth product divided by the noise gain of the circuit. For gains of 5, higher-order poles in the amplifiers'

transfer function contribute to even higher closed loop bandwidths. For example, the EL5134, EL5135, EL5234 and EL5235 have a -3dB bandwidth of 650MHz at a gain of 5, dropping to 150MHz at a gain of 10. It is important to note that the EL5134, EL5135, EL5234 and EL5235 is designed so that this "extra" bandwidth in low-gain application does not come at the expense of stability. As seen in the typical performance curves, the EL5134, EL5135, EL5234 and EL5235 in a gain of only 5 exhibited 0.2dB of peaking with a 500Ω load.

**Output Drive Capability**

The EL5134, EL5135, EL5234 and EL5235 are designed to drive a low impedance load. They can easily drive 6V<sub>P-P</sub> signal into a 500Ω load. This high output drive capability makes the EL5134, EL5135, EL5234 and EL5235 an ideal choice for RF, IF, and video applications. Furthermore, the EL5134, EL5135, EL5234 and EL5235 are current-limited at their outputs, allowing them to withstand momentary short to ground. However, the power dissipation with output-shortened cannot exceed the power dissipation capability of the package.

**Driving Cables and Capacitive Loads**

Although the EL5134, EL5135, EL5234 and EL5235 are designed to drive low impedance load, capacitive loads will decrease the amplifiers' phase margin. As shown in the performance curves, capacitive load can result in peaking, overshoot and possible oscillation. For optimum AC performance, capacitive loads should be reduced as much as possible or isolated with a series resistor between 5Ω to 20Ω. When driving coaxial cables, double termination is always recommended for reflection-free performance. When properly terminated, the capacitance of the coaxial cable will not add to the capacitive load seen by the amplifier.

**Disable/Power-Down**

The EL5134 and EL5234 amplifiers can be disabled placing their outputs in a high impedance state. When disabled, each amplifier current is reduced to 12uA. The EL5134 and EL5234 are disabled when their  $\overline{CE}$  pins are pulled up to within 1V of the power supply. Similarly, the amplifiers are enabled by floating or pulling its  $\overline{CE}$  pin to at least 3V below the positive supply. For +/-5V supply, this means that EL5134 and EL5234 amplifiers will be enabled when  $\overline{CE}$  is 2V or less, and disabled when  $\overline{CE}$  is above 4V. Although the logic levels are not standard TTL, this choice of logic voltages allows the EL5134 and EL5234 to be enabled by typing  $\overline{CE}$  to ground, even in 5V single supply applications. The  $\overline{CE}$  pin can be driven from CMOS outputs.

**Supply Voltage Range and Single-Supply Operation**

The EL5134, EL5135, EL5234 and EL5235 have been designed to operate with supply voltages having a span of greater than 5V and less than 12V. In practical terms, this means that they will operate on dual supplies ranging from

±2.5V to ±6V. With single-supply, the EL5134, EL5135, EL5234 and EL5235 will operate from 5V to 12V. To prevent internal circuit latch-up, the slew rate between the negative and positive supplies must be less than 1V/nS.

As supply voltages continue to decrease, it becomes necessary to provide input and output voltage ranges that can get as close as possible to the supply voltages. The EL5134, EL5135, EL5234 and EL5235 have an input range which extends to within 2V of either supply. So, for example, on ±5V supplies, the EL5134, EL5135, EL5234 and EL5235 have an input range which spans ±3V. The output range of the EL5134, EL5135, EL5234 and EL5235 is also quite large, extending to within 2V of the supply rail. On a ±5V supply, the output is therefore capable of swinging from -3.1V to +3.1V. Single-supply output range is larger because of the increased negative swing due to the external pull-down resistor to ground.

**Power Dissipation**

With the wide power supply range and large output drive capability of the EL5134, EL5135, EL5234 and EL5235, it is possible to exceed the 150°C maximum junction temperatures under certain load and power-supply conditions. It is therefore important to calculate the maximum junction temperature (T<sub>JMAX</sub>) for all applications to determine if power supply voltages, load conditions, or package type need to be modified for the EL5134, EL5135, EL5234 and EL5235 to remain in the safe operating area. These parameters are related as follows:

$$T_{JMAX} = T_{MAX} + (\theta_{JA} \times P_{D_{MAXTOTAL}})$$

where:

- P<sub>D<sub>MAXTOTAL</sub></sub> is the sum of the maximum power dissipation of each amplifier in the package (P<sub>D<sub>MAX</sub></sub>)
- P<sub>D<sub>MAX</sub></sub> for each amplifier can be calculated as follows:

$$P_{D_{MAX}} = 2 \times V_S \times I_{S_{MAX}} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L}$$

where:

- T<sub>MAX</sub> = Maximum ambient temperature
- θ<sub>JA</sub> = Thermal resistance of the package
- P<sub>D<sub>MAX</sub></sub> = Maximum power dissipation of 1 amplifier
- V<sub>S</sub> = Supply voltage
- I<sub>S<sub>MAX</sub></sub> = Maximum supply current of 1 amplifier
- V<sub>OUTMAX</sub> = Maximum output voltage swing of the application
- R<sub>L</sub> = Load resistance

**Power Supply Bypassing And Printed Circuit Board Layout**

As with any high frequency devices, good printed circuit board layout is essential for optimum performance. Ground

plane construction is highly recommended. Pin lengths should be kept as short as possible. The power supply pins must be closely bypassed to reduce the risk of oscillation. The combination of a 4.7 $\mu$ F tantalum capacitor in parallel with 0.1 $\mu$ F ceramic capacitor has been proven to work well when placed at each supply pin. For single supply operation, where pin 4 ( $V_{S-}$ ) is connected to the ground plane, a single 4.7 $\mu$ F tantalum capacitor in parallel with a 0.1 $\mu$ F ceramic capacitor across pin 8 ( $V_{S+}$ ).

For good AC performance, parasitic capacitance should be kept to a minimum. Ground plane construction again should be used. Small chip resistors are recommended to minimize series inductance. Use of sockets should be avoided since they add parasitic inductance and capacitance which will result in additional peaking and overshoot.
