AVAILABLE

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

## General Description

The MAX2828/MAX2829 single-chip, RF transceiver ICs are designed specifically for OFDM 802.11 WLAN applications. The MAX2828 is designed for single-band 802.11a applications covering world-band frequencies of 4.9GHz to 5.875GHz. The MAX2829 is designed for dual-band 802.11a/g applications covering world-bands of 2.4GHz to 2.5GHz and 4.9GHz to 5.875GHz. The ICs include all circuitry required to implement the RF transceiver function, providing a fully integrated receive path, transmit path, VCO, frequency synthesizer, and baseband/control interface. Only the PA, RF switches, RF bandpass filters (BPF), RF baluns, and a small number of passive components are needed to form the complete RF front-end solution.

Each IC completely eliminates the need for external SAW filters by implementing on-chip monolithic filters for both the receiver and transmitter. The baseband filtering and the Rx/Tx signal paths are optimized to meet the 802.11a/g IEEE standards and cover the full range of the required data rates (6, 9, 12, 18, 24, 36, 48, and 54Mbps for OFDM; 1, 2, 5.5, and 11Mbps for CCK/DSSS), at receiver sensitivity levels up to 10dB better than 802.11a/g standards. The MAX2828/MAX2829 transceivers are available in the small 56-pin, exposed paddle thin QFN package.

## Applications

Single-/Dual-Band 802.11a/b/g Radios  
4.9GHz Public Safety Radios  
2.4GHz/5GHz MIMO and Smart Antenna Systems

## Pin Configurations

## Features

- ◆ **World-Band Operation**  
MAX2828: 4.9GHz to 5.875GHz (802.11a)  
MAX2829: 2.4GHz to 2.5GHz and 4.9GHz to 5.875GHz (802.11a/b/g)
- ◆ **Best-In-Class Transceiver Performance**  
-75dBm Rx Sensitivity at 54Mbps (802.11g)  
-46dB (802.11g)/-51dB (802.11a) Tx Sideband Suppression  
1.5% (802.11g) and 2% (802.11a) Tx EVM  
-100dBc/Hz (802.11g)/-95dBc/Hz (802.11a) LO Phase Noise  
Programmable Baseband Lowpass Filters  
Integrated PLL with 3-Wire Serial Interface  
93dB (802.11g)/97dB (802.11a) Receiver Gain-Control Range  
200ns Rx I/Q DC Settling  
60dB Dynamic Range Rx RSSI  
30dB Tx Power-Control Range  
Tx/Rx I/Q Error Detection  
I/Q Analog Baseband Interface for Tx and Rx  
Digital Mode Selection (Tx, Rx, Standby, and Power Down)  
Supports Both Serial and Parallel Gain Control
- ◆ **MIMO and Smart Antenna Compatibility**  
Coherent LO Phase Among Multiple Transceivers
- ◆ Support 40MHz Channel Bandwidth (Turbo Mode)
- ◆ Single +2.7V to +3.6V Supply
- ◆ 1µA Low-Power Shutdown Mode
- ◆ Small 56-Pin TQFN Package (8mm x 8mm)

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX2828 ETN	-40°C to +85°C	56 TQFN-EP* (T5688-2)
MAX2829 ETN	-40°C to +85°C	56 TQFN-EP* (T5688-2)

\*EP = Exposed paddle.

Pin Configurations continued at end of data sheet.

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

## ABSOLUTE MAXIMUM RATINGS

V<sub>CC</sub>, TXRFH<sub>-</sub>, TXRFL<sub>-</sub> to GND.....-0.3V to +4.2V  
 RXRFH, RXRFL, TXBBI<sub>-</sub>, TXBBQ<sub>-</sub>, ROSC, RXBBI<sub>-</sub>, RXBBQ<sub>-</sub>,  
 RSSI, PABIAS, V<sub>REF</sub>, CPOUT, RXENA, TXENA, SHDN, CS,  
 SCLK, DIN, B<sub>-</sub>, RXHP, LD, R<sub>BIAS</sub>,  
 BYPASS to GND .....-0.3V to (V<sub>CC</sub> + 0.3V)  
 RXBBI<sub>-</sub>, RXBBQ<sub>-</sub>, RSSI, PABIAS, V<sub>REF</sub>, CPOUT,  
 LD Short-Circuit Duration.....10s

RF Input Power .....+10dBm  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
 56-Pin Thin QFN (derate 31.3mW/°C above +70°C).....2500mW  
 Operating Temperature Range .....-40°C to +85°C  
 Junction Temperature .....+150°C  
 Storage Temperature Range.....-65°C to +160°C  
 Lead Temperature (soldering, 10s) .....+300°C

 **CAUTION!** ESD SENSITIVE DEVICE

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(MAX2828/MAX2829 evaluation kits: V<sub>CC</sub> = 2.7V to 3.6V, Rx/Tx set to maximum gain, R<sub>BIAS</sub> = 11kΩ, no signal at RF inputs, all RF inputs and outputs terminated into 50Ω, receiver baseband outputs are open, no signal applied to Tx I/Q BB inputs in Tx mode, f<sub>REFOSC</sub> = 40MHz, registers set to default settings and corresponding test mode, T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = +2.7V and T<sub>A</sub> = +25°C, unless otherwise noted.) (Note 1)

## Pin Description

PIN		NAME	FUNCTION
MAX2828	MAX2829		
1	1	B6	Rx Front-End and Tx Gain-Control Digital Input Bit 6
2	2	V <sub>CC</sub>	2.4GHz/5GHz LNA Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
3	3	B7	Rx Front-End Gain-Control Digital Input Bit 7
4, 11, 12	—	N.C.	No Connection. Leave unconnected.
5	5	GND	LNA Ground. Make connections to ground vias as short as possible. Do not share ground vias with any of the other branches.
6	6	RXRFB	5GHz Single-Ended LNA Input. Requires AC-coupling and external matching network.
7	7	GND	LNA Ground. Make connections to ground vias as short as possible. Do not share ground vias with any other branches.
8	8	TXRFB+	5GHz Tx PA Driver Differential Outputs. Requires AC-coupling and external matching network (and balun) to the external PA input.
9	9	TXRFB-	
10	10	V <sub>CC</sub>	Tx RF Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
13	13	TXENA	Tx Mode Enable Digital Input. Set high to enable Tx (see Figure 1).
14	14	PABIAS	DAC Current Output. Connect directly to the external PA bias pin.
15	15	V <sub>CC</sub>	Tx Baseband Filter Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
16	16	TXBBI+	Tx Baseband I-Channel Differential Inputs
17	17	TXBBI-	
18	18	TXBBQ+	Tx Baseband Q-Channel Differential Inputs
19	19	TXBBQ-	
20	20	V <sub>CC</sub>	Tx Upconverter Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
21	21	RBIAS	This Analog Voltage Input is Internally Biased to a Bandgap Voltage. Connect an external precision 11k $\Omega$ resistor or current source between this pin and ground to set the bias current for the device.
22	22	V <sub>CC</sub>	Reference Circuit Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
23	23	V <sub>REF</sub>	Reference Voltage Output
24	24	GND	Digital Circuit Ground. Make connections to ground vias as short as possible. Do not share ground vias with any other branches.
25	25	V <sub>CC</sub>	Digital Circuit Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.

## Pin Description (continued)

MAX2828/MAX2829

PIN		NAME	FUNCTION
MAX2828	MAX2829		
26	26	DIN	Data Digital Input of 3-Wire Serial Interface (See Figure 2)
27	27	SCLK	Clock Digital Input of 3-Wire Serial Interface (See Figure 2)
28	28	$\overline{CS}$	Active-Low Enable Digital Input of 3-Wire Serial Interface (See Figure 2)
29	29	LD	Lock-Detect Digital Output of Frequency Synthesizer. Output high indicates that the frequency synthesizer is locked.
30	30	ROSC	Reference Oscillator Input. Connect an external reference oscillator to this analog input.
31	31	VCC	PLL Charge-Pump Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
32	32	GND	Charge-Pump Circuit Ground. Make connections to ground vias as short as possible. Do not share ground vias with any other branches.
33	33	CPOUT	Charge-Pump Output. Connect the frequency synthesizer's loop filter between CPOUT and TUNE. Keep the line from this pin to the tune input as short as possible to prevent spurious pickup. Connect C2 as close to CPOUT as possible. Do not share the capacitor ground vias with any other branches (see the <i>Typical Operating Circuit</i> ).
34	34	GND	Ground. Make connections to ground vias as short as possible. Do not share ground vias with any other branches.
35	35	GND	VCO Ground. Make connections to ground vias as short as possible. Do not share ground vias with any other branches.
36	36	TUNE	VCO TUNE Input. Connect C1 as close to TUNE as possible. Connect the ground of C1 to VCO ground. Do not share the capacitor ground vias with any other branches (see the <i>Typical Operating Circuit</i> ).
37	37	BYPASS	Bypass with a 0.1 $\mu$ F Capacitor to GND. The capacitor is used by the on-chip VCO voltage regulator.
38	38	VCC	VCO Supply Voltage. Bypass to system ground as close as possible to the pin with capacitors. Do not share the ground vias for the bypass capacitors with any other branches.
39	39	SHDN	Active-Low Shutdown Digital Input. Set high to enable the device.
40	40	RSSI	RSSI or Temperature-Sensor Multiplexed Output
41	41	RXENA	Rx Mode Enable Digital Input. Set high to enable Rx.
42	42	RXHP	Rx Baseband AC-Coupling Highpass Corner Frequency Control Digital Input Selection Bit
43	43	RXBBQ-	Rx Baseband Q-Channel Differential Outputs. In Tx calibration mode, these pins are the LO leakage and sideband-detector outputs.
44	44	RXBBQ+	
45	45	RXBBI-	Rx Baseband I-Channel Differential Outputs. In Tx calibration mode, these pins are the LO leakage and sideband-detector outputs.
46	46	RXBBI+	
47	47	VCC	Rx Baseband Buffer Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.
48	48	B1	Rx/Tx Gain-Control Digital Input Bit 1
49	49	VCC	Rx Baseband Filter Supply Voltage. Bypass with a capacitor as close to the pin as possible. Do not share the bypass-capacitor ground vias with any other branches.

## Detailed Description

The MAX2828/MAX2829 single-chip, RF transceiver ICs are designed for WLAN applications. The MAX2828 is designed for 5GHz 802.11a (OFDM), and the MAX2829 is designed for dual-band 2.4GHz 802.11b/g and 5GHz 802.11a. The ICs include all circuitry required to implement the RF transceiver function, fully integrating the receive path, transmit path, VCO, frequency synthesizer, and baseband/control interface.

### Modes of Operation

The MAX2828/MAX2829 have seven primary modes of operation: shutdown, SPI reset, standby, transmit, receive, transmitter calibration, and receiver calibration (see Table 5).

SPI is a trademark of Motorola, Inc.

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

MAX2828/MAX2829

## **Shutdown Mode**

Shutdown mode is achieved by driving  $\overline{\text{SHDN}}$  low. In shutdown mode, all circuit blocks are powered down, except for the serial interface. While the device is in shutdown, the values of the serial interface registers are maintained and can be changed as long as  $V_{CC}$  (pin 25) is applied.

## **SPI Reset**

By driving RXENA and TXENA high while setting  $\overline{\text{SHDN}}$  low, all circuit blocks are powered down, as in shutdown mode. However, in SPI reset mode, all registers are returned to their default states. It is recommended to reset the SPI and all registers at the start of power-up to ensure that the registers are set to the correct values (see Table 9).

## **Standby Mode**

To place the device in standby mode, set  $\overline{\text{SHDN}}$  high and RXENA and TXENA low. This mode is mainly used to enable the frequency synthesizer block while the rest of the device is powered down. In this mode, various blocks in the system can be selectively turned on or off according to the standby register table (Table 10).

## **Receive (Rx) Mode**

To place the device in Rx mode, set RXENA high. All receiver blocks are enabled in this mode.

## **Transmit (Tx) Mode**

To place the device in Tx mode, set TXENA high. All transmitter blocks are enabled in this mode.

## **Tx/Rx Calibration Mode**

The MAX2828/MAX2829 feature Tx/Rx calibration modes to detect I/Q imbalances and transmit LO leakage. In the Tx calibration mode, the LO leakage calibration is done only for the LO leakage signal that is present at the center frequency of the channel (i.e., in the middle of the OFDM or QPSK spectrum). The LO leakage calibration includes the effect of all DC offsets in the entire baseband paths of the I/Q modulator, and also includes direct leakage of the LO to the I/Q modulator output.

The transmitter LO leakage and sideband-detector output is taken at the receiver I- or Q-channel output during this calibration phase.

During Tx LO leakage and I/Q imbalance calibration, a sine and cosine signal ( $f = f_{\text{TONE}}$ ) is input to the baseband I/Q Tx pins from the baseband IC. At the LO leakage and sideband-detector output, the LO leakage corresponds to the signal at  $f_{\text{TONE}}$  and the sideband suppression corresponds to the signal at  $2 \times f_{\text{TONE}}$ . The output power of these signals vary 2dB for 1dB of variation in the LO leakage and unwanted sideband levels. To calibrate the Tx path, first set the power-detector gain to 8dB (Table 14). Adjust the DC offset of the baseband inputs to minimize the signal at  $f_{\text{TONE}}$  (LO leakage). Then, adjust the baseband input relative magnitude and phase offsets to reduce the signal at  $2 \times f_{\text{TONE}}$ . If required, calibration can be done with higher LO leakage and sideband-detector gain settings to decrease LO leakage and increase image suppression.

After calibrating the transmitter, receiver calibration can be done. In Rx calibration mode, the calibrated Tx RF signal is internally routed to the Rx downconverter inputs. In this loopback calibration mode, the voltage regulator must be able to source 350mA total since both Tx and Rx are turned on simultaneously.

## **RF Synthesizer Programming in 5GHz Mode**

In the 5GHz mode, the RF frequency synthesizer covers a 4.9GHz to 5.9GHz range. To achieve this large tuning range while maintaining excellent noise performance, the 1GHz band is divided into sub-bands within which the VCO is tuned. The selection of the appropriate VCO sub-band is done automatically by a finite state machine (FSM). The PLL settling time is approximately 300 $\mu$ s for a change of 1GHz in the channel frequency. A faster PLL settling can be achieved by overriding the FSM and manually programming the VCO sub-band.

## **Automatic VCO Sub-Band Selection**

By enabling this band-selection mode, only 1 bit needs to be programmed to start the frequency acquisition. The FSM will automatically stop after it selects the correct VCO sub-band, and after the PLL has locked.

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

**Table 6. B1:B0 VCO Sub-Band Assignments (Read Back Through Lock-Detect Pin)**

B1	B0	VCO FREQUENCY BAND
0	0	Band 0 (lowest frequency band)
0	1	Band 1
1	0	Band 2
1	1	Band 3 (highest frequency band)

The following steps should be followed:

- 1) Set D8 = 0 (A3:A0 = 0101) to enable the automatic VCO sub-band selection by the FSM.
- 2) Enable the PLL and VCO if required. If required, program the divider ratios corresponding to the desired channel frequency.
- 3) Set D7 = 1 (A3:A0 = 0101) to start the FSM. The FSM should only be started after PLL and VCO are enabled, or after channel frequency is changed.
- 4) The VCO sub-band selection and PLL settling time takes less than approximately 300 $\mu$ s. After the band switching is completed and the PLL has locked to the correct channel frequency, the FSM stops automatically.

Every time the channel frequency is programmed or the PLL+VCO is enabled, the FSM needs to be reset to be used again for the next time. This reset operation does not affect the PLL or VCO. To reset the FSM, set D7 = 0 (A3:A0 = 0101).

Every channel frequency maps to some VCO sub-band. Each VCO sub-band has a digital code, of which the 2 LSBs (B1:B0) are readable. The B1:B0 code can be read through pin LD by programming D3:D0 = 0111 (A3:A1 = 0000) for B1, or D3:D0 = 0110 (A3:A1 = 0000) for B0 (see Table 6).

### Manual VCO Sub-Band Selection

For faster settling, the VCO sub-band (B1:B0) can be directly programmed through the SPI. First, the B1:B0 code for every channel frequency must be determined. Once this is known, the B1:B0 code is directly programmed along with the PLL divider values, for the given channel frequency. The PLL settling time in this case is approximately 50 $\mu$ s.

Large temperature changes (>+50°C) may cause the channel frequency to move into an adjacent sub-band. To determine the correct sub-band, two on-chip comparators monitor the VCO control voltage (VTUNE). These comparator logic outputs can be read through

**Table 7. D10:D9 VCO Sub-Band Assignments (For Programming Through SPI)**

D10	D9	PROGRAMMED VCO FREQUENCY BAND
0	0	Band 0
0	1	Band 1
1	0	Band 2
1	1	Band 3

**Table 8. Comparator-Output Definition**

A3:A1 = 0000; D3:D0 = 0101	A3:A1 = 0000; D3:D0 = 0100	RESPONSE
0	0	Program to a lower sub-band if VCO is not in Band 0.
0	1	No change.
1	0	Program to a higher sub-band if VCO is not in Band 3.
1	1	Invalid state, does not occur.

the LD pin to decide whether the frequency sub-band is correct or needs to be reprogrammed.

The following steps need to be followed to complete manual PLL frequency acquisition and VCO sub-band selection:

- 1) Set D8 = 1 (A3:A0 = 0101) to enable manual VCO sub-band selection.
- 2) Enable the PLL and VCO if required. If required, program the divider ratios corresponding to the desired channel frequency.
- 3) Set D10:D9 (A3:A0 = 0101) to program the VCO frequency sub-band according to Table 7. D10:D9 correspond to the same assignments as B1:B0. After D10:D9 are programmed, 50 $\mu$ s is required to allow the PLL to settle.
- 4) After 50 $\mu$ s of PLL settling time, the comparator outputs can be read through pin LD (see Table 8).
- 5) Based on the comparator outputs, the VCO frequency sub-band is programmed again according to Table 8 until the frequency acquisition is achieved.

### Large Temperature Changes

If the PLL and VCO are continuously active (i.e., no reprogramming) and the die temperature changes by 50°C (as indicated by the on-chip temperature sensor), there is a possibility that the PLL may get unlocked due

to the VCO drifting to an adjacent sub-band. In this case, it is advisable to reprogram the PLL by either manual or automatic sub-band selection.

### Programmable Registers

The MAX2828/MAX2829 include 13 programmable, 18-bit registers: 0, 1, standby, integer-divisor ratio, fractional-divisor ratio, band select and PLL, calibration, lowpass filter, Rx control/RSSI, Tx linearity/baseband gain, PA bias DAC, Rx gain, and Tx VGA gain. The 14 most significant bits (MSBs) are used for register data. The 4 least significant bits (LSBs) of each register contain the register address. Data is shifted in MSB first. The data sent to the devices, in 18-bit words, is framed by  $\overline{CS}$ . When  $\overline{CS}$  is low, the clock is active and data is shifted with the rising edge of the clock. When  $\overline{CS}$  transitions high, the shift register is latched into the register selected by the contents of the address bits. Only the last 18 bits shifted into the device are retained in the shift register. No check is made on the number of clock pulses. For programming data words less than 14 bits long, only the required data bits and the address bits are required to be shifted, resulting in faster Rx and Tx gain control where only the LSBs need to be pro-

### Standby Register Definition (A3:A0 = 0010)

Various internal blocks can be turned on or off using the standby register (in standby mode, see Table 10). Setting a bit to 1 turns the block on, while setting a bit to 0 turns the block off.

### Integer-Divider Ratio Register Definition (A3:A0 = 0011)

This register contains the integer portion of the divider ratio of the synthesizer. This register, in conjunction with the fractional-divider ratio register, permits selection of a precise frequency. The main synthesizer divide ratio is an 8-bit value for the integer portion (see Table 11). Valid values for this register are from 128 to 255 (D7–D0). The default value is 210. D13 and D12 are reserved for the 2 LSBs of the fractional-divider ratio.

### Fractional-Divider Ratio Register Definition (A3:A0 = 0100)

This register (along with D13 and D12 of the integer-divider ratio register) controls the fractional-divider ratio with 16-bit resolution. D13 to D0 of this register combined with D13 and D12 of the integer-divider ratio register form the whole fractional-divider ratio (see Tables 12a and 12b).

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

**Table 13. Band-Select and PLL Register (A3:A0 = 0101)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0 for Normal Operation. Set to 1 for MIMO applications.
D12	1	Set D12:D11 = 11
D11	1	
D10	0	These Bits Set the VCO Sub-Band when Programmed Using the SPI (D8 = 1). D10:D9 = 00: lowest frequency band; 11: highest frequency band.
D9	0	
D8	0	VCO SPI Bandswitch Enable. 0: disable SPI control, bandswitch is done by FSM; 1: bandswitch is done by SPI programming.
D7	0	VCO Bandswitch Enable. 0: disable; 1: start automatic bandswitch.
D6	0	RF Frequency Band Select in 802.11a Mode (D0 = 1). 0: 4.9GHz to 5.35GHz Band; 1: 5.47GHz to 5.875GHz Band.
D5	1	PLL Charge-Pump-Current Select. 0: 2mA; 1: 4mA.
D4	0	Set to 0
D3	0	These Bits Set the Reference-Divider Ratio. D3:D1 = 001 corresponds to R = 1 and 111 corresponds to R = 7.
D2	1	
D1	0	
D0	0	RF Frequency Band Select. 0: 2.4GHz Band; 1: 5GHz band.

### **Band-Select and PLL Register Definition (A3:A0 = 0101)**

This register configures the programmable-reference frequency dividers for the synthesizers, and sets the DC current for the charge pump. The programmable-reference frequency divider provides the reference frequencies to the phase detector by dividing the crystal oscillator frequency (see Table 13).

### **Calibration Register Definition (A3:A0 = 0110)**

This register configures the Rx/Tx calibration modes (See Table 14).

**Table 14. Calibration Register  
(A3:A0 = 0110)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0
D12	1	Transmitter I/Q Calibration LO Leakage and Sideband-Detector Gain-Control Bits. D12:D11 = 00: 8dB; 01: 18dB; 10: 24dB; 11: 34dB
D11	1	
D10	1	Set to 1
D9	0	Set to 0
D8	0	
D7	0	
D6	0	
D5	0	
D4	0	
D3	0	
D2	0	
D1	0	0: Tx Calibration Mode Disabled; 1: Tx Calibration Mode Enabled (Rx outputs provide the LO leakage and sideband-detector signal)
D0	0	0: RX Calibration Mode Disabled; 1: Rx Calibration Mode Enabled

**Table 15. Lowpass-Filter Register (A3:A0 = 0111)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0
D12	0	
D11	0	RSSI High Bandwidth Enable. 0: 2MHz; 1: 6MHz
D10	0	Set to 0
D9	0	
D8	0	
D7	0	
D6	0	Tx LPF Corner Frequency Coarse Adjustment. D6:D5 = 00: undefined; 01: 12MHz (nominal mode); 10: 18MHz (turbo mode 1); 11: 24MHz (turbo mode 2).
D5	1	
D4	0	Rx LPF Corner Frequency Coarse Adjustment. D4:D3 = 00: 7.5MHz; 01: 9.5MHz (nominal mode); 10: 14MHz (turbo mode 1); 11: 18MHz (turbo mode 2).
D3	1	
D2	0	Rx LPF Corner Frequency Fine Adjustment (Relative to the Course Setting). D2:D0 = 000: 90%; 001: 95%; 010: 100%; 011: 105%; 100: 110%.
D1	1	
D0	0	

**Lowpass Filter Register Definition (A3:A0 = 0111)**

This register allows the adjustment of the Rx and Tx lowpass filter corner frequencies (see Table 15).

**Rx Control/RSSI Register Definition (A3:A0 = 1000)**

This register allows the adjustment of the Rx section and the RSSI output (see Tables 16a and 16b).

**Table 16a. Rx Control/RSSI Register (A3:A0 = 1000)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0
D12	0	Enable Rx VGA Gain Programming Serially. 0: Rx VGA gain programmed with external digital inputs (B7:B1); 1: Rx VGA gain programmed with serial data bits in the Rx gain register (D6:D0).
D11	0	RSSI Output Range. 0: low range (0.5V to 2V); 1: high range (0.5V to 2.5V).
D10	0	RSSI Operating Mode. 0: RSSI disabled if RXHP = 0, and enabled if RXHP = 1; 1: RSSI enabled independent of RXHP (see Table 16c).
D9	0	Set to 0
D8	0	RSSI Pin Function. 0: outputs RSSI signal in Rx mode; 1: outputs temperature sensor voltage in Rx, Tx, and standby modes (see Table 16c).
D7	0	Set to 0
D6	0	
D5	1	Set to 1
D4	0	Set to 0
D3	0	
D2	1	Rx Highpass -3dB Corner Frequency when RXHP = 0. 0: 100Hz; 1: 30kHz
D1	0	Set D1:D0 = 01
D0	1	

# Single-/Dual-Band 802.11a/b/g World-Band Transceiver ICs

**Table 16b. Rx HP -3dB Corner Frequency Adjustment**

RXHP	A3:A0 = 1000, D2	Rx HP -3dB CORNER FREQUENCY
1	X	600kHz
0	1	30kHz
0	0	100Hz

**Table 16c. RSSI Pin Truth Table**

INPUT CONDITIONS				RSSI OUTPUT

0	0	0	X	No Signal
0	0	1	0	No Signal
0	0	1	1	RSSI
0	1	0	X	No Signal
0	1	1	X	RSSI
1	X	X	X	Temperature Sensor

***Tx Linearity/Baseband Gain Register Definition***  
**(A3:A0 = 1001)**

This register allows the adjustment of the Tx gain and linearity (see Table 17).

**Table 17. Tx Linearity/Baseband Gain Register (A3:A0 = 1001)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0
D12	0	
D11	0	
D10	0	Enable Tx VGA Gain Programming Serially. 0: Tx VGA gain programmed with external digital inputs (B6:B1); 1: Tx VGA gain programmed with data bits in the Tx gain register (D5:D0).
D9	1	PA Driver Linearity. D9:D8 = 00: 50% current (minimum linearity); 01: 63% current; 10: 78% current; 11: 100% current (maximum linearity).
D8	0	
D7	0	Tx VGA Linearity. D7:D6 = 00: 50% current (minimum linearity); 01: 63% current; 10: 78% current; 11: 100% current (maximum linearity).
D6	0	
D5	0	Set to 0
D4	0	
D3	0	Tx Upconverter Linearity. D3:D2 = 00: 50% current (minimum linearity); 01: 63% current; 10: 78% current; 11: 100% current (maximum linearity).
D2	0	
D1	0	Tx Baseband Gain. D1:D0 = 00: max baseband gain - 5dB; 01: max baseband gain - 3dB; 10: max baseband gain - 1.5dB; 11: max baseband gain.
D0	0

**Table 18. PA Bias DAC Register  
(A3:A0 = 1010)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Set to 0
D12	0	
D11	0	
D10	0	
D9	1	Sets PA bias DAC turn-on delay after TXENA is set high and A3:A0 = 0010, D10 = 1, in steps of 0.5 $\mu$ s. D9:D6 = 0001 corresponds to 0 $\mu$ s and 1111 corresponds to 7 $\mu$ s.
D8	1	
D7	1	
D6	1	
D5	0	Sets PA bias DAC output current in steps of 5 $\mu$ A. D5:D0 = 000000 corresponds to 0 $\mu$ A and 111111 corresponds to 315 $\mu$ A.
D4	0	
D3	0	
D2	0	
D1	0	
D0	0	

**Table 19. Rx Gain Register  
(A3:A0 = 1011)**

DATA BIT	DEFAULT	DESCRIPTION	
D13	0	Not Used. For faster Rx gain setting, only D6:D0 need to be programmed.	
D12	0		
D11	0		
D10	0		
D9	0		
D8	0		
D7	0		
D6	1	Rx LNA Gain Control	Rx baseband and RF gain-control bits. D6 maps to digital input pin B7 and D0 maps to digital input pin B1. D6:D0 = 0000000 corresponds to minimum gain.
D5	1	Rx VGA Gain Control	
D4	1	Rx VGA Gain Control	
D3	1		
D2	1		
D1	1		
D0	1		

**Table 20. Tx VGA Gain Register  
(A3:A0 = 1100)**

DATA BIT	DEFAULT	DESCRIPTION
D13	0	Not Used. For faster Tx VGA gain setting, only D5:D0 need to be programmed.
D12	0	
D11	0	
D10	0	
D9	0	
D8	0	
D7	0	
D6	0	Tx VGA Gain Control. D5 maps to digital input pin B6 and D0 maps to digital input pin B1. D5:D0 = 000000 corresponds to minimum gain.
D5	0	
D4	0	
D3	0	
D2	0	
D1	0	
D0	0	

**PA Bias DAC Register Definition (A3:A0 = 1010)**

This register controls the output current of the DAC, which biases the external PA (see Table 18).

**Rx Gain Register Definition (A3:A0 = 1011)**

This register sets the Rx baseband and RF gain when A3:A0 = 1000, D12 = 1 (see Table 19).

**Tx VGA Gain Register Definition (A3:A0 = 1100)**

This register sets the Tx VGA gain when A3:A0 = 1001, D10 = 1 (see Table 20).

## Applications Information

### MIMO Applications

The MAX2828/MAX2829 support multiple input multiple output (MIMO) applications where multiple transceivers are used in parallel. A special requirement for this application is that all receivers must maintain a constant relative local oscillator phase, and that they continue to do so after any receive-transmit-receive mode switching. The same requirement holds for the transmitters—they should all maintain a constant relative phase, and continue to do so after any transmit-receive-transmit mode switching. This feature is enabled in the MAX2828/MAX2829 by programming A3:A0 = 0010, D13 = 1 and A3:A0 = 0101, D13 = 1. The constant relative phases of the multiple transceivers are maintained in the transmit, receive, and standby modes of operation, as long as they are all using a common external reference frequency source (crystal oscillator).

## Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages).)

MAX2828/MAX2829

**DALLAS SEMICONDUCTOR** **MAXIM**  
 PROPRIETARY INFORMATION  
 TITLE: PACKAGE OUTLINE, 56L THIN QFN, 8x8x0.8mm  
 APPROVAL: \_\_\_\_\_ DOCUMENT CONTROL NO. 21-0135 REV. D 1/2

### NOTES:

1. DIE THICKNESS ALLOWABLE IS 0.225mm MAXIMUM (0.009 INCHES MAXIMUM).
2. DIMENSIONING & TOLERANCES CONFORM TO ASME Y14.5M. - 1994.
3. N IS THE NUMBER OF TERMINALS.  
Nd IS THE NUMBER OF TERMINALS IN X-DIRECTION &  
Ne IS THE NUMBER OF TERMINALS IN Y-DIRECTION.
4. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.20 AND 0.25mm FROM TERMINAL TIP.
5. THE PIN #1 IDENTIFIER MUST BE LOCATED ON THE TOP SURFACE OF THE PACKAGE WITHIN HATCHED AREA AS SHOWN. EITHER AN INDENTATION MARK OR INK/LASER MARK IS ACCEPTABLE.
6. ALL DIMENSIONS ARE IN MILLIMETERS.
7. PACKAGE WARPAGE MAX 0.01mm.
8. APPLIES TO EXPOSED PAD AND TERMINALS. EXCLUDES INTERNAL DIMENSION OF EXPOSED PAD.
9. MEETS JEDEC MO220.
