

# **LH0076 Negative Precision Programmable Regulator**

### **General Description**

The LH0076 is a precision programmable regulator for negative voltages. Regulated output voltages from 0 to -27V may be obtained by using 1 external resistor. Also available without any external components are several fixed regulated voltages with accuracies to 0.1% (-3V, -5V, -6V, -8V, -9V, -12V, -15V and -18V). The output current limit is adjustable from 0 to 200 mA using 2 external resistors. These features provide an inventory of precision regulated values in 1 package.

#### **Features**

- Line regulation typically 0.005%/V
- Load regulation typically 0.02%
- Remote voltage sensing
- Ripple rejection-70 dB
- Output Adjustable to 0V
- Adjustable precision current limit
- Output current to 200 mA

## **Electrical Characteristics** Conditions are for $T_{MIN} \le T_A \le T_{MAX}$ unless otherwise noted

Parameter	Conditions	LH0076			LH0076C			Units
rarameter	Conditions	Min Typ		Max	Min	Тур	Max	Jinto
Line Regulation	T <sub>A</sub> = 25°C		0.005	0.02		0.005	0.04	%/V
Load Regulation	$T_A$ = 25°C, 1 mA < I <sub>LOAD</sub> < 200 mA $V_{OUT}$ $\geq$ -5.0V $V_{OUT}$ $\leq$ -5.0V		0.02	7.5 0.15		0.02	15 0.3	mV %
Reference Current (I <sub>REF</sub> )	$T_A = 25^{\circ}C, V_{ N} = -15V$	0.998	1.000	1.002	0.995	1.000	1.005	mA
Reference Current Drift (ΔI <sub>REF</sub> /ΔTemp.)	V <sub>IN</sub> = -15V		-0.0065			-0.0065		%/°C
Minimum Load Current (I <sub>LIM</sub> )	(Note 1)	98	100	102	95	100	105	μΑ
Output Voltage Range		0		-27	0		-27	V
Minimum Input Voltage		-10			-10			٧
Input-Output Differential Voltage	T <sub>A</sub> = 25°C, 1 mA < I <sub>LOAD</sub> < 200 mA		2.7	3.2		2.7	3.5	٧
Quiescent Supply Current	V <sub>IN</sub> = -15V		11	15		11	15	mA
Ripple Rejection	V <sub>OUT</sub> = 5.0V, f = 120 Hz		70			70		dB
Output Voltage Tolerance	T <sub>A</sub> = 25°C, (Note 2)		±0.1	±0.5		±0.1	± 1.0	%
Output Voltage Change with Temperature ( $\Delta V_{OUT}/\Delta T$ emp.)	(Note 3)		0.003			0.003		%/°C

Note 1: Minimum load current is established by ILIM, the current to Q2 (see schematic.) ILIM draws directly from the output if the current limit feature is used.

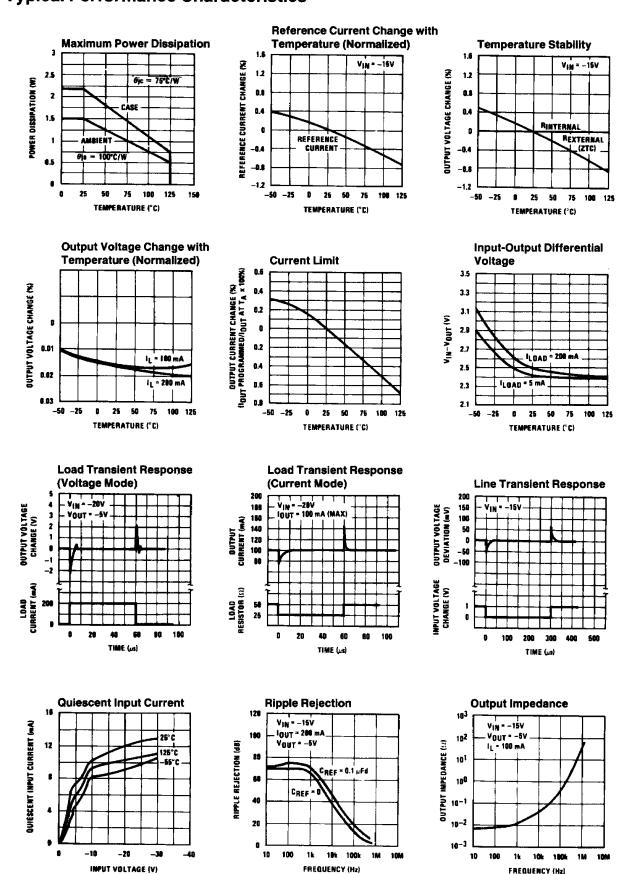

Note 2: For  $V_{\text{IN}}$  = 15V and  $V_{\text{OUT}}$  obtained by using R4, R5, R6, and R8 individually.

Note 3: Total change over specified temperature range.

Note 4: Refer to RETS0076G for military specifications on the LH0076.

\*Recommended if device is far from filter capacitors

## **Application Information**

The LH0076 does not require external capacitors for stable operation. However, an input bypass is recommended if the device is far from filter capacitors. A 0.1  $\mu$ F for input bypassing should be adequate for most applications.

#### **DESCRIPTION OF OPTIONS**

### **External Voltage Programming**

An external resistance can be connected between pin 10 and ground to obtain any voltage from 0 to -27V using the following equation:

$$R_{EXT} = \frac{V_{OUT} \text{ desired}}{-1 \text{ mA}}$$

The reference current (I<sub>REF</sub>) has a typical temperature coefficient of -60 ppm/°C. Choosing a resistive material with a temperature coefficient of 60 ppm/°C will compensate the negative tempco of the reference current, resulting in an output voltage with minimal change over the operating temperature range. Example of a good resistive material is nichrome, which has a typical tempco of 80 ppm/°C. Nichrome is the resistive material used in the LH0076, resulting in output voltage drift of 20 ppm/°C typically.

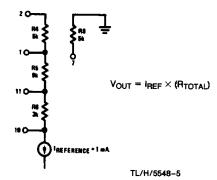

### **Application Information (Continued)**

Because a current source is used as a reference, remote voltage programming is possible.

#### **Internal Voltage Programming**

The LH0076 provides various precision output voltages simply by using 1 or more of the internal programming resistors. These voltages may be obtained by using the connections as shown in Table 1.

R<sub>TOTAL</sub> is the total resistance between pin 10 and ground

R4, R5, R6 and R8 are precision trimmed to 0.1%

#### FIGURE 1

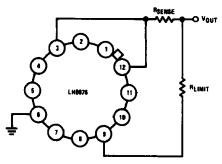

#### **Current Limit Programming**

The maximum current output of the device may be limited by adding 2 external resistors as shown in *Figure 2*. The resistor values are calculated using the following equation:

$$I_{OUT(MAX)} = \left[\frac{R_{LIMIT}}{R_{SENSE}} + 1\right] \times 100 \mu A$$

where  $R_{SENSE} = 1$  to  $10\Omega$ 

This programming current limit feature can be extended to make the LH0076 a programmable current sink. This can be done by leaving pin 10 open and setting R<sub>LIMIT</sub> and R<sub>SENSE</sub> as desired. (See *Figure 3*).

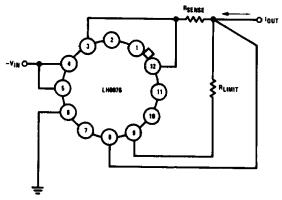

TL/H/5548-6

#### FIGURE 2. Current Limit Programming

For application where the current limit is used, a minimum load current of 100  $\mu$ A is established at the output. This arises from the fact that the constant current used in setting maximum output current is 100  $\mu$ A, and it comes directly from the output of the LH0076. If the total current is less than this minimum current, the output will drop.

As in the remote voltage adjustment application, remote current sensing can be applied similarly. RSENSE should be placed as close to the output of the LH0076 as possible, but  $R_{LIMIT}$  can be a resistor or potentiometer located remotely from the device.
