

7Ω Quad SPST Switches with Over-Rail Signal Handling

MAX4854

General Description

The MAX4854 quad single-pole/single-throw (SPST) switch operates from a single +2V to +5.5V supply and can handle signals greater than the supply rail. This switch features low 7Ω on-resistance with 30pF on-capacitance, making it ideal for switching data signals.

For over-rail applications, this device passes signals greater than the positive supply (up to +5.5V) through the switch without distortion.

The MAX4854 is available in the space-saving, 16-pin, 3mm x 3mm thin QFN package and operates over the -40°C to +85°C extended temperature range.

Features

- ◆ USB 2.0 Full Speed (12Mbps) and USB 1.1 Signal Switching
- ◆ Switches Signals Greater than V_{CC}
- ◆ 7Ω On-Resistance
- ◆ 30pF On-Capacitance
- ◆ 150MHz, -3dB Bandwidth
- ◆ 1.8V Logic Compatibility
- ◆ +2V to +5.5V Supply Range
- ◆ Low 0.01μA Supply Current
- ◆ Available in a Space-Saving, 3mm x 3mm, 16-Pin TQFN Package

Applications

- USB Switching
- Cellular Phones
- Notebook Computers
- PDA's and Other Handheld Devices

Note 1: Signals on IN₋, NO₋, or COM₋ below GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7Ω Quad SPST Switches with Over-Rail Signal Handling

Detailed Description

The MAX4854 low on-resistance, low-voltage, analog switch is designed to operate from a +2V to +5.5V single supply and is fully specified for nominal +3.0V applications. The device features over-rail signal capability that allows signals up to +5.5V with supply voltages down to +2.0V to pass through without distortion.

This quad SPST switch has low on-channel capacitance, which allows switching of the data signals for USB 2.0/1.1 applications (12Mbps). It is designed to switch D+ and D- USB signals with a guaranteed skew of less than 1ns (see Figure 2) as measured from 50% of the input signal to 50% of the output signal.

Applications Information

Digital Control Inputs

The logic inputs (IN_n) accept up to +5.5V even if the supply voltages are below this level. For example, with a +3.3V V_{CC} supply, IN_n can be driven low to GND and high to +5.5V, allowing for mixing of logic levels in a system. Driving IN_n rail-to-rail minimizes power consumption. For a +2V supply voltage, the logic thresholds are +0.5V (low) and +1.4V (high); for a +5V supply voltage, the logic thresholds are +0.8V (low) and +1.8V (high).

Analog Signal Levels

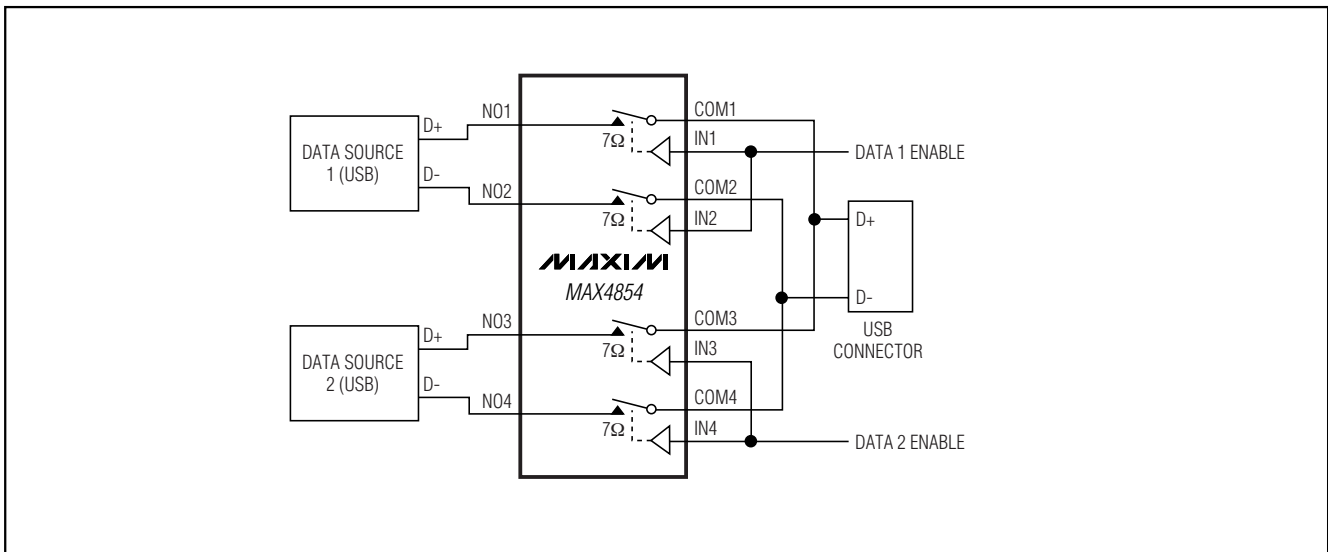

The on-resistance of these switches changes very little for analog input signals across the entire supply voltage range (see the *Typical Operating Characteristics*). The switches are bidirectional; therefore, NO_n and COM_n can be either inputs or outputs.

Power-Supply Sequencing

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying analog signals, especially if the analog signal is not current limited.
