## DATA SHEET

## 74F257A

Quad 2-line to 1-line selector/multiplexer, non-inverting (3-State)

Product specification<br>IC15 Data Handbook

Philips Semic onductors

## Quad 2-line to 1-line selector/multiplexer, non-inverting (3-State)

## FEATURES

- Industrial range available $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$
- Multifunction capability
- Non-inverting data path
- 3-State outputs
- See 74F258A for inverting version

## DESCRIPTION

The 74F257A has four identical 2-input multiplexers with 3-State outputs which select 4 bits of data from two sources uncer control of a common Select (S) input. The IOa inputs are selected when the common Select input is Low and the I1n inputs are selected when the common Select input is High. Data appears at the outputs in true non-inverted form from the selected inputs. The 74F257A is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the common Slect input. Outputs are forced to a high impedance "off" state when the Output Enable (OE) is High. All but one device must be in high impedance state to avoid currents that would exceed the maximum rating if the outputs were tied together. Design of the Output Enable signals must ensure that there is no overlap when outputs of 3 -state devices were tied together.

## PIN CONFIGURATION

| TYPE | TYPICAL <br> PROPAGATION DELAY | TYPICAL <br> SUPPLY CURRENT <br> (TOTAL) |
| :---: | :---: | :---: |
| 74 F 257 A | 4.3 ns | 12 mA |

ORDERING INFORMATION

| DESCRIPTION | ORDER CODE |  | DRAWING <br> NUMBER |

## APPLICATION

Quad 2-line to 1-line selector/multiplexer, non-inverting (3-State)

## ABSOLUTE MAXIMUM RATINGS

(Operation beyond the limits set forth in this table may impair the useful life of the device.
Unless otherwise noted these limits are over the operating free-air temperature range.)

| SYMBOL | PARAMETER | RATING | UNIT |
| :--- | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply voltage | -0.5 to +7.0 | V |
| $\mathrm{~V}_{\mathrm{IN}}$ | Input voltage | -0.5 to +7.0 | V |
| $\mathrm{I}_{\mathrm{I}}$ | Input current | -30 to +5 | mA |
| $\mathrm{~V}_{\text {OUT }}$ | Voltage applied to output in High output state | -0.5 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{I}_{\mathrm{OUT}}$ | Current applied to output in Low output state | 48 | mA |
| $\mathrm{~T}_{\text {amb }}$ | Operating free-air temperature range | Commercial range | 0 to +70 |
|  | Storage temperature range | Industrial range | -40 to +85 |

## RECOMMENDED OPERATING CONDITIONS

| SYMBOL | PARAMETER |  | LIMITS |  |  | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | MIN | NOM | MAX |  |

|  |  | $\mathrm{I}_{\mathrm{CCz}}$ |  |  |  | 15.0 | 23.0 | mA |

## NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{amb}}=25^{\circ} \mathrm{C}$.
3. Not more than one output should be shorted at a time. For testing los, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, los tests should be performed last.
4. Measure $\mathrm{I}_{\mathrm{CC}}$ with all outputs open and inputs grounded.
