

Thermocouple Cold Junction Compensator and Matched Amplifier

FEATURES

- 0.75°C Initial Accuracy (A Version)
- Extremely Low Warmup Drift
- Preset Outputs for Type E, J, K, R, S, T
- Single 5V to ±20V Operation
- 480µA Typical Supply Current
- Available in 8-Pin DIP Package

APPLICATIONS

- Thermocouple Cold Junction Compensation

DESCRIPTION

The LTK001 is a thermocouple amplifier supplied with a matched cold junction compensator. By separating the amplifier and compensator functions, the problem of compensator temperature rise is virtually eliminated. The compensator is a selected version of the LT[®]1025 cold junction compensator. The amplifier, which is also available separately as LTKA0x has been specially selected for

thermocouple applications. It has low supply current to minimize warmup drift, very low offset voltage (<35µV), high gain, and extremely low input bias currents (<600pA) to allow high impedance input filters to be used without degrading offset voltage or drift.

Matching of the kits is accomplished by separating the compensators and amplifiers according to the polarity of their initial (room temperature) errors. This eliminates the need to sum the errors of the two components to find the worst-case error.

The LTK001 has direct thermocouple outputs of 60.9µV/°C (E), 51.7µV/°C (J), 40.6µV/°C (K, T), and 5.95µV/°C (R, S). It also has a 10mV/°C output which can be scaled to match any arbitrary thermocouple.

For multiple thermocouple applications using one compensator, amplifiers may be ordered separately (LTKA0x), still matched to the compensator.

LT, LTC and LT are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners. For typical performance curves and applications circuits consult the LT1025 data sheet.

TYPICAL APPLICATION

Type K 10mV/°C Thermometer

ABSOLUTE MAXIMUM RATINGS (Note 1)

Amplifier (LTKA0x)

Supply Voltage (Total V^+ to V^-) 40V
 Differential Input Current (Note 2) $\pm 10\text{mA}$
 Common Mode Input Voltage Equal to Supplies
 Output Short-Circuit Duration Indefinite

Compensator (LT1025)

Supply Voltage (V_{IN} to Ground Pin) 36V
 Output Voltage (Forced) 5V
 Output Short-Circuit Duration Indefinite

Both Devices

Operating Temperature Range

LTK001AMJ8, LTK001MJ8 (**OBSOLETE**)

..... -55°C to 125°C

LTK001ACN8, LTK001CN8 0°C to 70°C

Storage Temperature Range -65°C to 150°C

Lead Temperature Range (Soldering, 10 sec.) 300°C

PACKAGE/ORDER INFORMATION

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: The inputs of the LTKA0x amplifier are clamped with diodes, so a differential voltage rating does not apply.

Note 3: Total temperature error is the overall error at 25°C taking into account the offset of the amplifier, the offset at the compensator $10\text{mV}/^\circ\text{C}$ output, and the error in the compensator divider network. Warmup drift is not included.

Note 4: Slope error is the increase in total temperature error as ambient temperature is increased. It is guaranteed by design and by other tests, but is not tested directly.

Note 5: This is a worst-case limit assuming that any or all supply voltages change.

Note 6: Guaranteed, but not tested.

Note 7: By referring common mode range to the supplies, the range referred to ground can be quickly calculated for any given supply voltage. With a single 5V supply, for instance, which has a worst-case low value of 4.7V , the upper common mode limit is $4.7\text{V} - 1\text{V} = 3.7\text{V}$. The lower common mode limit is $0\text{V} + 0.75\text{V} = 0.75\text{V}$. With $\pm 15\text{V}$ supplies, the limits would be 14V and -14.25V , respectively. Common mode range has a temperature sensitivity of $\approx 2\text{mV}/^\circ\text{C}$.

Note 8: Absolute output voltage swing is calculated by subtracting the given limits from actual supply voltage. These limits indicate the point where offset voltage has changed suddenly by $5\mu\text{V}$.

Note 9: Temperature error is defined as the deviation from the following formula:

$$V_{OUT} = \alpha(T) + \alpha\beta(T - 25^\circ\text{C})^2$$

α = Typical thermocouple Seebeck coefficient as follows,

E = $60.9\mu\text{V}/^\circ\text{C}$, J = $51.7\mu\text{V}/^\circ\text{C}$, K, T = $40.6\mu\text{V}/^\circ\text{C}$, R, S = $5.95\mu\text{V}/^\circ\text{C}$.

$\alpha = 10\text{mV}/^\circ\text{C}$ at the 10mV output.

β = Nonlinearity coefficient built into the LT1025 to help compensate for the nonlinearities of thermocouples. $\beta = 5.5 \times 10^{-4}$, generating 0.34°C bow for 25°C temperature change, and 1.36°C bow for 50°C change.

Note 10: Temperature error at the individual outputs is the sum of the $10\text{mV}/^\circ\text{C}$ output error plus the resistor divider error.

Note 11: Line and load regulation do not take into account the effects of self-heating. Output changes due to self-heating can be calculated as follows:

$$\Delta V_{OUT} (\text{Line}) = \Delta V_{IN}(I_Q + I_{load})(150^\circ\text{C}/\text{W})$$

$$\Delta V_{OUT} (\text{Load}) = (\Delta I_{load})(V_{IN})(150^\circ\text{C}/\text{W}) \\ = \text{LT1025 supply current}$$

Load regulation is $30\mu\text{A} \leq I_O \leq 1\text{mA}$ for $T_A \leq 0^\circ\text{C}$.

Note 12: Larger errors with type R and S thermocouples are due mostly to $35\mu\text{V}$ offset of the amplifier. This error can be reduced to $5\mu\text{V}$ max with the LTC[®]1050 or LTC1052 operational amplifiers.

PACKAGE DESCRIPTION

H Package
8-Lead TO-5 Metal Can (.200 Inch PCD)
 (Reference LTC DWG # 05-08-1320)

* LEAD DIAMETER IS UNCONTROLLED BETWEEN THE REFERENCE PLANE AND THE SEATING PLANE
 ** FOR SOLDER DIP LEAD FINISH, LEAD DIAMETER IS $.016 - .024$ (0.406 - 0.610) H8(TO-5) 0.200 PCD 0204

OBsolete PACKAGE

PACKAGE DESCRIPTION

J8 Package 8-Lead Cerdip (Narrow .300 Inch, Hermetic) (Reference LTC DWG # 05-08-1110)

OBSOLETE PACKAGE

PACKAGE DESCRIPTION

N8 Package 8-Lead PDIP (Narrow .300 Inch) (Reference LTC DWG # 05-08-1510)

NOTE:

1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$

*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)
