AMC7635

300mA CMOS
LOW DROPOUT REGULATOR

www.addmtek.com

DESCRIPTION

The AMC7635 of positive, linear regulator features low noise and low dropout voltage, making it ideal for battery applications. The space-saving SOT-23-5 package is attractive for "Pocket" and "Hand Held" applications.

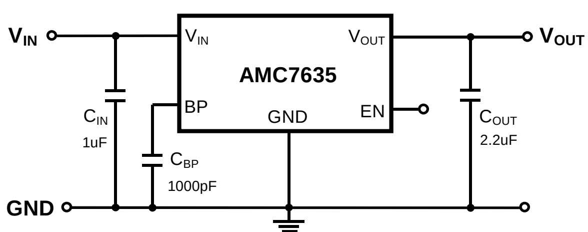
In applications requiring a low noise, regulated supply, place a 1000pF capacitor between Bypass and Ground.

The AMC7635 is stable with an output capacitance of 2.2µF or greater.

FEATURES

- **Guaranteed 300mA Output**
- **Accurate to within 1.5%**
- **Very Low Dropout Voltage**
- **Over-Temperature Shutdown**
- **Power-Saving Shutdown Mode**
- **Current Limiting**
- **Noise Reduction Bypass Capacitor**
- **Factory Pre-set Output Voltages**
- **Low Temperature Coefficient**
- **Available in SOT-23-5 packages**

TYPICAL APPLICATION CIRCUIT



APPLICATIONS

- **Wireless Devices**
- **Portable Electronics**
- **Cordless Phones**
- **PC Peripherals**
- **Battery Powered Widgets**
- **Electronic Scales**
- **Instrumentation**

ABSOLUTE MAXIMUM RATINGS (Note)

Input Voltage, V_{IN}	7V
Operating Junction Temperature Range, T_J	0°C to 150°C
Storage Temperature Range, T_{STG}	-65°C to 150°C
Lead Temperature (soldering, 10 seconds)	260°C

Note: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.

DB PACKAGE:	
Thermal Resistance from Junction to Ambient, θ_{JA}	220℃/W

Junction Temperature Calculation: $T_J = T_A + (PD \times \theta_{JA})$.
The θ_{JA} numbers are guidelines for the thermal performance of the device/pc-board system. Connect the ground pin to ground using a large pad or ground plane for better heat dissipation. All of the above assume no ambient airflow.

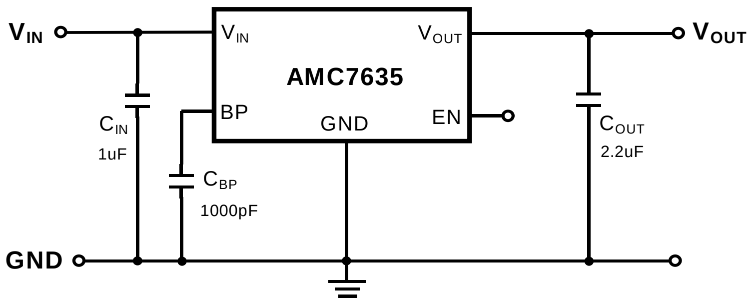
APPLICATION INFORMATION



◆ Detailed Description

The AMC7635 CMOS low dropout regulator contains a PMOS pass transistor, a voltage reference, an error amplifier, over-current protection, and thermal shutdown circuit.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference. Thermal shutdown and over-current circuits become active when the junction temperature exceeds 150℃, or the current exceeds 300mA. During thermal shutdown, the output voltage remains low. Normal operation is restored when the junction temperature drops below 120℃.

◆ External Capacitors

The AMC7635 is stable with an output capacitor to ground of 2.2μF or greater. Ceramic capacitors have the lowest ESR, and will offer the best AC performance. Conversely, Aluminum Electrolytic capacitors exhibit the highest ESR, resulting in the poorest AC response. Unfortunately, large value ceramic capacitors are comparatively expensive. One option is to parallel a 0.1μF ceramic capacitor with a 10μF Aluminum Electrolytic. The benefit is low ESR, high capacitance, and low over-all cost.

A second capacitor is recommended between the input and ground to stabilize V_{IN}. The input capacitor should be at least 0.1μF to have a beneficial effect.

A third capacitor can be connected between the BP pin and GND. This capacitor can be a low cost Polyester Film variety between the value of 0.001 ~ 0.01μF. A larger capacitor improves the AC ripple rejection, but also makes the output come up slowly. This "Soft" turn-on is desirable in some applications to limit turn-on surges.

All capacitors should be placed in close proximity to the pins. A "Quiet" ground termination is desirable. This can be achieved with a "Star" connection.

◆ EN

The EN pin is normally pulled to high. When shutdown, pulled low, the PMOS pass transistor shuts off, and all internal circuits are powered down. In this state, the quiescent current is less than 1μA. This pin behaves much like an electronic switch.
