

# FSBH0F70WA, FSBH0170W, FSBH0270W Green Mode Fairchild Power Switch (FPS™)

## Features

- Brownout Protection with Hysteresis
- Built-In 5ms Soft-Start Function
- Internal Avalanche-Rugged 700V SenseFET
- Low Acoustic Noise During Light-Load Operation
- High-Voltage Startup
- Linearly Decreasing PWM Frequency to 18KHz
- Peak-Current-Mode Control
- Cycle-by-Cycle Current Limiting
- Leading-Edge Blanking (LEB)
- Synchronized Slope Compensation
- Internal Open-Loop Protection
- $V_{DD}$  Under-Voltage Lockout (UVLO)
- $V_{DD}$  Over-Voltage Protection (OVP)
- Internal Auto-Restart Circuit (OVP, OTP)
- Constant Power Limit (Full AC Input Range)
- Internal OTP Sensor with Hysteresis

## Applications

General-purpose switched-mode power supplies and flyback power converters, including:

- Auxiliary Power Supply for PC and Server
- SMPS for VCR, SVR, STB, DVD & DVCD Player, Printer, Facsimile, and Scanner
- Adapter for Camcorder

## Description

The highly integrated FSBH-series consists of an integrated current-mode Pulse Width Modulator (PWM) and an avalanche-rugged 700V SenseFET. It is specifically designed for high-performance offline Switched-Mode Power Supplies (SMPS) with minimal external components.

The integrated PWM controller features include a proprietary green-mode function that provides off-time modulation to linearly decrease the switching frequency at light-load conditions to minimize standby power consumption. To avoid acoustic-noise problems, the minimum PWM frequency is set above 18kHz. This green-mode function enables the power supply to meet international power conservation requirements. The PWM controller is manufactured using the BiCMOS process to further reduce power consumption. The FSBH-series turns off some internal circuits to improve power saving when  $V_{FB}$  is lower than 1.6V, which allows an operating current of only 2.5mA.

The FSBH-series has built-in synchronized slope compensation to achieve stable peak-current-mode control. The proprietary external line compensation ensures constant output power limit over a wide AC input voltage range, from 90V<sub>AC</sub> to 264V<sub>AC</sub>.

The FSBH-series provides many protection functions. In addition to cycle-by-cycle current limiting, the internal open-loop protection circuit ensures safety when an open-loop or output short occurs. PWM output is disabled until  $V_{DD}$  drops below the  $V_{TH-OLP}$ , then the controller starts up again. As long as  $V_{DD}$  exceeds 28V, the internal OVP circuit is triggered.

Compared with a discrete MOSFET and controller or RCC switching converter solution, the FSBH-series reduces component count, design size, and weight; while increasing efficiency, productivity, and system reliability. These devices provide a basic platform that is well suited for the design of cost-effective flyback converters, such as in PC auxiliary power supplies.

## Ordering Information

Part Number	SenseFET	VIN Pin (PIN #4)	Operating Temperature Range	Package	Packing Method
FSBH0F70WANY	0.5A 700V	Not Available	-40°C to +105°C	8-Pin, Dual In-Line Package (DIP)	Tube
FSBH0170WNY	1.0A 700V	Enabled			
FSBH0270WNY	2.0A 700V				

## Typical Application Diagram

Figure 1. Typical Flyback Application

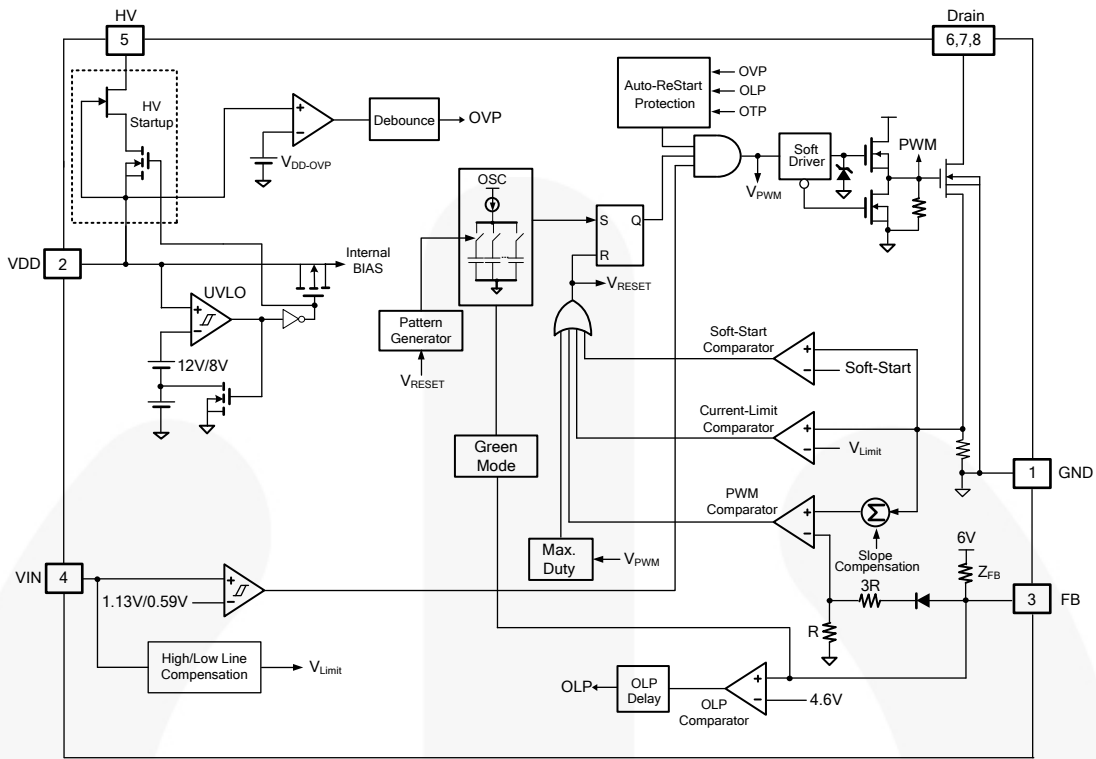

Table 1. Output Power Table<sup>(1)</sup>

Product	230V <sub>AC</sub> ± 15% <sup>(2)</sup>		85-265V <sub>AC</sub>	
	Adapter <sup>(3)</sup>	Open Frame <sup>(4)</sup>	Adapter <sup>(3)</sup>	Open Frame <sup>(4)</sup>
FSBH0F70WA	7W	10W	6W	8W
FSBH0170W	10W	15W	9W	13W
FSBH0270W	14W	20W	11W	16W

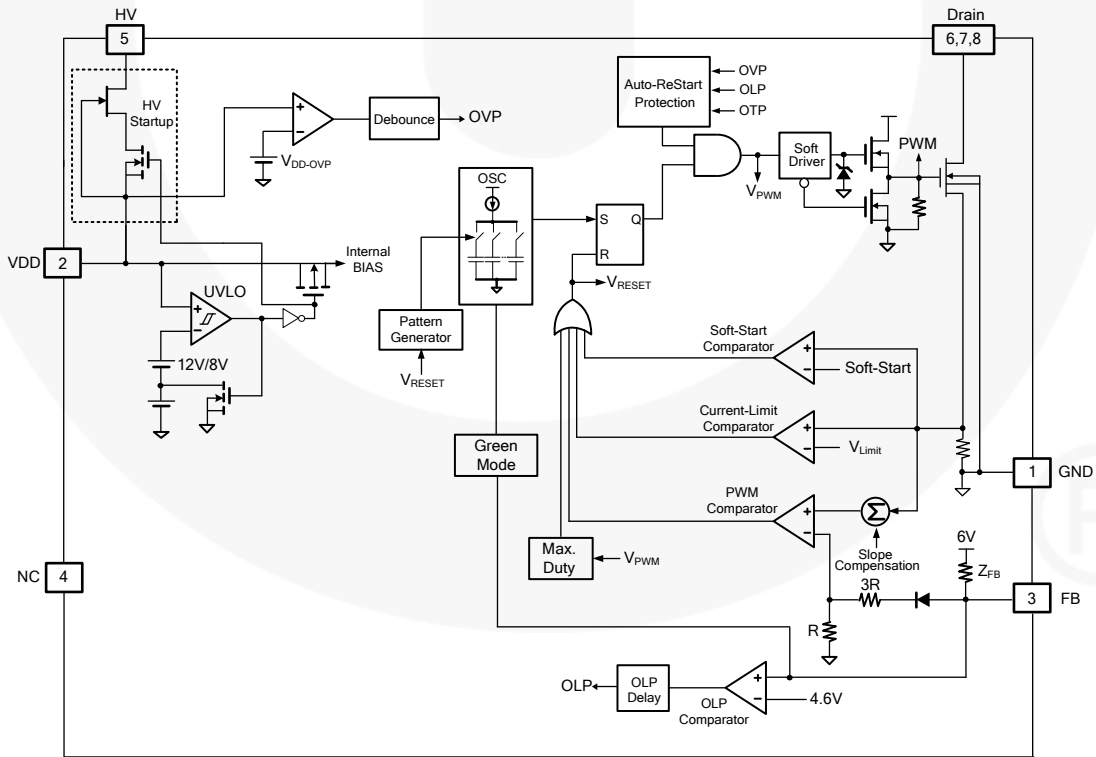

### Notes:

1. The maximum output power can be limited by junction temperature.
2. 230 V<sub>AC</sub> or 100/115 V<sub>AC</sub> with doublers.
3. Typical continuous power in a non-ventilated enclosed adapter with sufficient drain pattern as a heat sink at 50°C ambient.
4. Maximum practical continuous power in an open-frame design with sufficient drain pattern as a heat sink at 50°C ambient.

## Pin Configuration

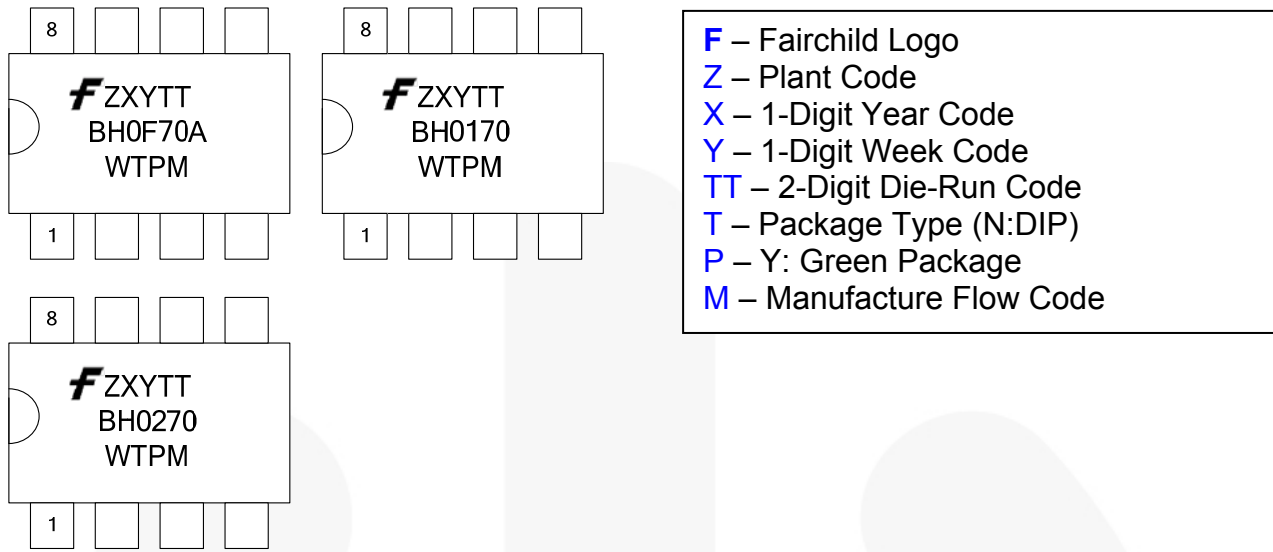

Figure 4. Pin Configuration and Top Mark Information

## Pin Definitions

Pin #	Name	Description
1	GND	<b>Ground.</b> SenseFET source terminal on primary side and internal controller ground.
2	VDD	<b>Power Supply.</b> The internal protection circuit disables PWM output as long as $V_{DD}$ exceeds the OVP trigger point.
3	FB	<b>Feedback.</b> The signal from the external compensation circuit is fed into this pin. The PWM duty cycle is determined in response to the signal on this pin and the internal current-sense signal.
4	VIN	<b>Line-Voltage Detection.</b> The line-voltage detection is used for brownout protection with hysteresis and constant output power limit over universal AC input range.
	NC	No Connection for FSBH0F70WA
5	HV	<b>Startup.</b> For startup, this pin is pulled HIGH to the line input or bulk capacitor via resistors.
6	Drain	<b>SenseFET Drain.</b> High-voltage power SenseFET drain connection.
7	Drain	<b>SenseFET Drain.</b> High-voltage power SenseFET drain connection.
8	Drain	<b>SenseFET Drain.</b> High-voltage power SenseFET drain connection.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

### Notes:

- All voltage values, except differential voltages, are given with respect to the network ground terminal.
- Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device.
- Non-repetitive rating; pulse width is limited by maximum junction temperature.
- L = 51mH, starting T<sub>J</sub> = 25°C.
- Measured on the package top surface.
- Internally Limited of T<sub>J</sub> refers to T<sub>OTP</sub>

## Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

## Functional Description

### Startup Operation

The HV pin is connected to bulk voltage through an external resistor,  $R_{HV}$ , as shown in Figure 22. When AC voltage is applied to the power system, an internal HV startup circuit provides a high current (around 3.5mA) to charge an external  $V_{DD}$  capacitor until  $V_{DD}$  voltage exceeds the turn-on threshold voltage ( $V_{DD-ON}$ ). For lower power consumption, the HV startup circuit shuts down during normal operation. The external  $V_{DD}$  capacitor and auxiliary winding maintain the  $V_{DD}$  voltage and provide operating current to controller.

Figure 22. Startup Circuit

### Slope Compensation

The FSBH-series is designed for flyback power converters. The peak-current-mode control is used to optimize system performance. Slope compensation is added to reduce current loop gain and improve power system stability. The FSBH-series has a built-in, synchronized, positive slope for each switching cycle.

### Soft-Start

The FSBH-series has an internal soft-start circuit that reduces the SenseFET switching current during power system startup. The characteristic curve of soft-start time versus  $V_{LMT}$  level is shown in Figure 1. The  $V_{LMT}$  level rises in six steps. By doing so, the power system can smoothly build up the rated output voltage and effectively reduce voltage stress on the PWM switch and output diode.

Figure 23. Soft-Start Function

### Brown-In/Out Function

FSBH0170W/0270W has a built-in internal brown-in/out protection comparator monitoring voltage of the VIN pin. Figure 24 shows a resistive divider with low-pass filtering for line-voltage detection on the VIN pin.

Figure 24. Brown-In/Out Function on VIN Pin

Once the VIN pin voltage is lower than 0.6V and lasts for 500ms, the PWM gate is disabled to protect the system from over current. FSBH0170W/0270W starts up as  $V_{IN}$  increases above 1.1V. Because the divider resistors of the VIN pin are connected behind the bridge, the ratio calculations for brownout in PFC and non-PFC system are different, as shown in Figure 1. The formulas are provided in the following equations:

Brownout with PFC:

$$\frac{R_C}{R_A + R_B + R_C} \cdot \sqrt{2} V_{AC\_OUT} \cdot \frac{2}{\pi} = 0.6 \quad (1)$$

Brownout with non-PFC:

$$\frac{R_C}{R_A + R_B + R_C} \cdot \sqrt{2} V_{AC\_OUT} = 0.6 \quad (2)$$

Brown-in level is determined by:

$$V_{AC\_IN} = \frac{1.1}{\sqrt{2}} \cdot \frac{R_A + R_B + R_C}{R_C} \quad (3)$$

Figure 25.  $V_{IN}$  Level According to PFC Operation

### Brown-In Function of FSBH0F70WA

The VIN pin functions are disabled from FSBH0F70WA which still exist brown-in protection in  $V_{DD}$  pin. There is a discharge current internal from  $V_{DD}$  to ground during startup. The HV source current must be larger than  $I_{DD-ST}$  to charge the capacitor of  $V_{DD}$ . The brown-in level can be determined by  $R_{HV}$  according to the equation:

$$R_{HV} = \frac{\sqrt{2} V_{AC} - 12}{I_{DD-ST}} \quad (4)$$

### Green-Mode Operation

The FSBH-series uses feedback voltage ( $V_{FB}$ ) as an indicator of the output load and modulates the PWM frequency, as shown in Figure 26, such that the switching frequency decreases as load decreases. In heavy-load conditions, the switching frequency is 100kHz. Once  $V_{FB}$  decreases below  $V_{FB-N}$  (2.5V), the PWM frequency starts to linearly decrease from 100kHz to 18kHz to reduce switching losses. As  $V_{FB}$  decreases below  $V_{FB-G}$  (2.0V), the switching frequency is fixed at 18kHz and the FSBH-series enters “deep” green mode to reduce the standby power consumption.

Figure 26. PWM Frequency

As  $V_{FB}$  decreases below  $V_{FB-ZDC}$  (1.6V), the FSBH-series enters burst-mode operation. When  $V_{FB}$  drops below  $V_{FB-ZDC}$ , FSBH-series stops switching and the output voltage starts to drop, which causes the feedback voltage to rise. Once  $V_{FB}$  rises above  $V_{FB-ZDC}$ , switching resumes. Burst mode alternately enables and disables switching, thereby reducing switching loss to improve power saving, as shown in Figure 1.

Figure 27. Burst-Mode Operation

### H/L Line Over-Power Compensation

To limit the output power of the converter constantly, high/low line over-power compensation is included. Sensing the converter input voltage through the  $V_{IN}$  pin, the high/low line compensation function generates a relative peak-current-limit threshold voltage for constant power control, as shown in Figure 28.

Figure 28. Constant Power Control

### Protections

The FSBH-series provides full protection functions to prevent the power supply and the load from being damaged. The protection features include:

#### Open-Loop / Overload Protection (OLP)

When the upper branch of the voltage divider for the shunt regulator (KA431 shown) is broken, as shown in Figure 29, or over current or output short occurs, there is no current flowing through the opto-coupler transistor, which pulls the feedback voltage up to 6V.

When feedback voltage is above 4.6V for longer than 56ms, OLP is triggered. This protection is also triggered when the SMPS output drops below the nominal value longer than 56ms due to the overload condition.

#### V<sub>DD</sub> Over-Voltage Protection (OVP)

$V_{DD}$  over-voltage protection prevents IC damage caused by over voltage on the  $V_{DD}$  pin. The OVP is triggered when  $V_{DD}$  voltage reaches 28V. Debounce time (typically 130 $\mu$ s) prevents false trigger by switching noise.

#### Over-Temperature Protection (OTP)

The SenseFET and the control IC are integrated, making it easier to detect the temperature of the SenseFET. As the temperature exceeds approximately 142°C, thermal shutdown is activated.

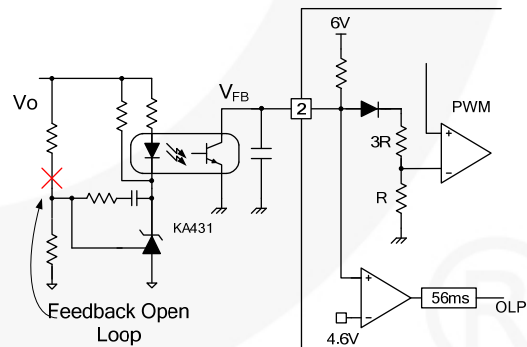

Figure 29. OLP Operation

### Physical Dimensions

NOTES:

- A) THIS PACKAGE CONFORMS TO JEDEC MS-001 VARIATION BA
- B) CONTROLLING DIMS ARE IN INCHES
- C) DIMENSIONS ARE EXCLUSIVE OF BURRS, MOLD FLASH, AND TIE BAR EXTRUSIONS.
- D) DIMENSIONS AND TOLERANCES PER ASME Y14.5M-1982
- E) DRAWING FILENAME AND REVISION: MKT-N08MREV1.

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, [www.fairchildsemi.com](http://www.fairchildsemi.com), under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative / In Design	Datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	Datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	Datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	Datasheet contains specifications on a product that is discontinued by Fairchild Semiconductor. The datasheet is for reference information only.
