

## HIGH SIDE DRIVER

| TYPE      | R <sub>DS(on)</sub> | I <sub>OUT</sub> | V <sub>CC</sub> |
|-----------|---------------------|------------------|-----------------|
| VN920D-B5 | 18 mΩ               | 30 A             | 36 V            |
| VN920DSO  |                     |                  |                 |

- CMOS COMPATIBLE INPUT
- ON STATE OPEN LOAD DETECTION
- OFF STATE OPEN LOAD DETECTION
- SHORTED LOAD PROTECTION
- UNDervoltage AND OVERVOLTAGE SHUTDOWN
- PROTECTION AGAINST LOSS OF GROUND
- VERY LOW STAND-BY CURRENT
- REVERSE BATTERY PROTECTION (\*)

### DESCRIPTION

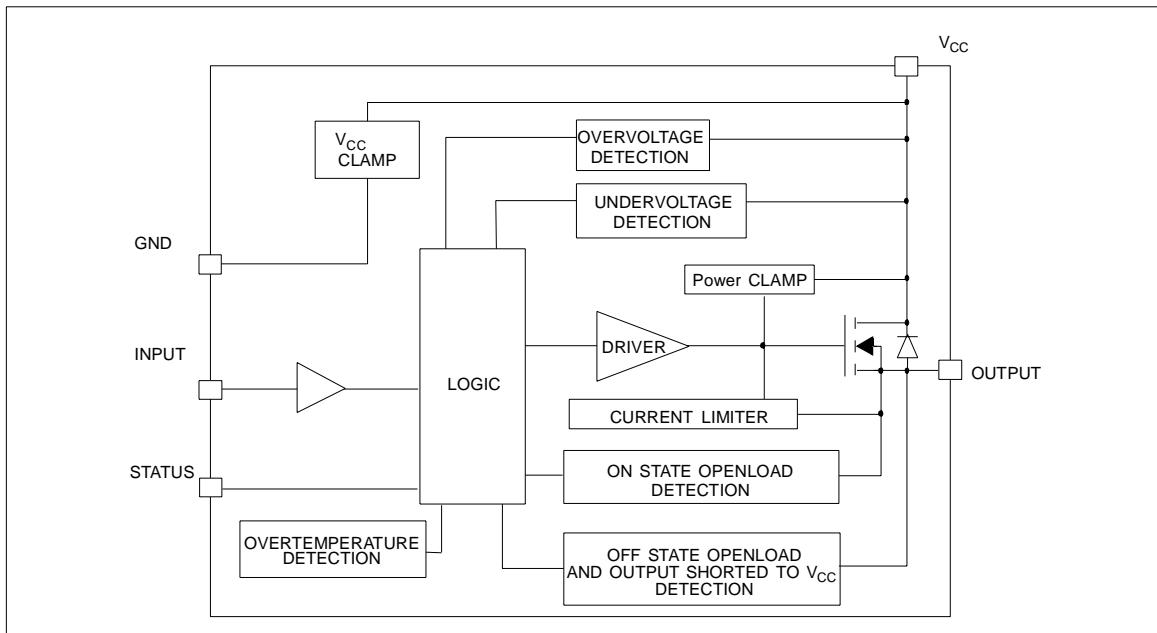

The VN920D-B5, VN920DSO are monolithic devices made by using STMicroelectronics VIPower M0-3 Technology, intended for driving any kind of load with one side connected to ground. Active V<sub>CC</sub> pin voltage clamp protects the device against low energy spikes (see ISO7637

transient compatibility table). Active current limitation combined with thermal shutdown and automatic restart protect the device against overload.

The device detects open load condition both in on and off state. Output shorted to V<sub>CC</sub> is detected in the off state. Device automatically turns off in case of ground pin disconnection.

## APPLICATION SCHEMATIC

### GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line ( $R_{GND}$  only). This can be used with any type of load.

The following is an indication on how to dimension the  $R_{GND}$  resistor.

- 1)  $R_{GND} \leq 600\text{mV} / (I_{S(on)\max})$ .
- 2)  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in  $R_{GND}$  (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)\max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the  $R_{GND}$  will produce a shift ( $I_{S(on)\max} * R_{GND}$ ) in the input thresholds and the status output values. This shift will vary depending on many devices are ON in the case of several high side drivers sharing the same  $R_{GND}$ .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode ( $D_{GND}$ ) in the ground line.

A resistor ( $R_{GND}=1\text{k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network will produce a shift ( $\approx 600\text{mV}$ ) in the input threshold and the status output values if the microprocessor ground is not common with the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

Series resistor in INPUT and STATUS lines are also required to prevent that, during battery voltage transient, the current exceeds the Absolute Maximum Rating.

Safest configuration for unused INPUT and STATUS pin is to leave them unconnected.

### LOAD DUMP PROTECTION

$D_{Id}$  is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds  $V_{CC}$  max DC rating. The same applies if the device will be subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO T/R 7637/1 table.

### μC I/Os PROTECTION:

If a ground protection network is used and negative transient are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the  $\mu$ C I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of  $\mu$ C and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of  $\mu$ C I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IH\max}$$

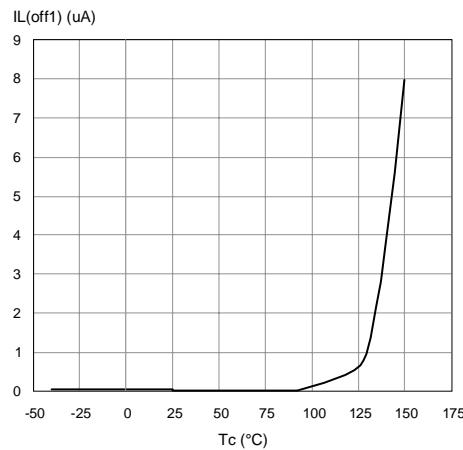

Calculation example:

For  $V_{CCpeak} = -100\text{V}$  and  $I_{latchup} \geq 20\text{mA}$ ;  $V_{OH\mu C} \geq 4.5\text{V}$   
 $5\text{k}\Omega \leq R_{prot} \leq 65\text{k}\Omega$ .

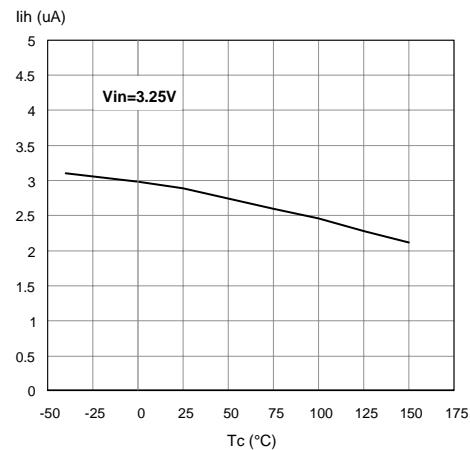

Recommended  $R_{prot}$  value is  $10\text{k}\Omega$ .

### P<sup>2</sup>PAK Maximum turn off current versus load inductance

A = Single Pulse at  $T_{Jstart}=150^\circ\text{C}$

B = Repetitive pulse at  $T_{Jstart}=100^\circ\text{C}$

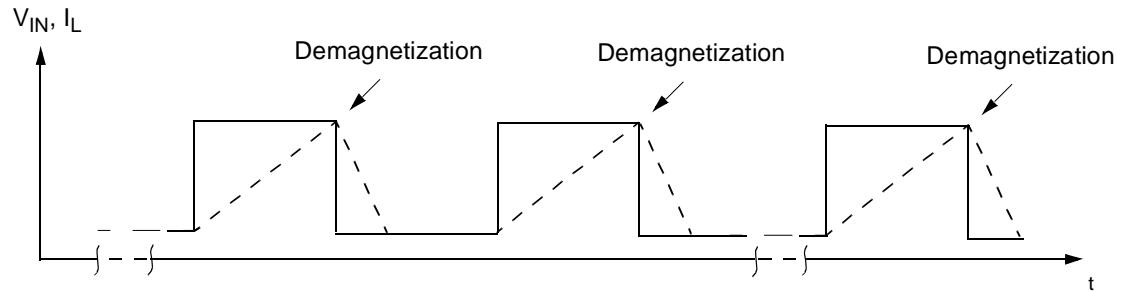

C = Repetitive Pulse at  $T_{Jstart}=125^\circ\text{C}$

#### Conditions:

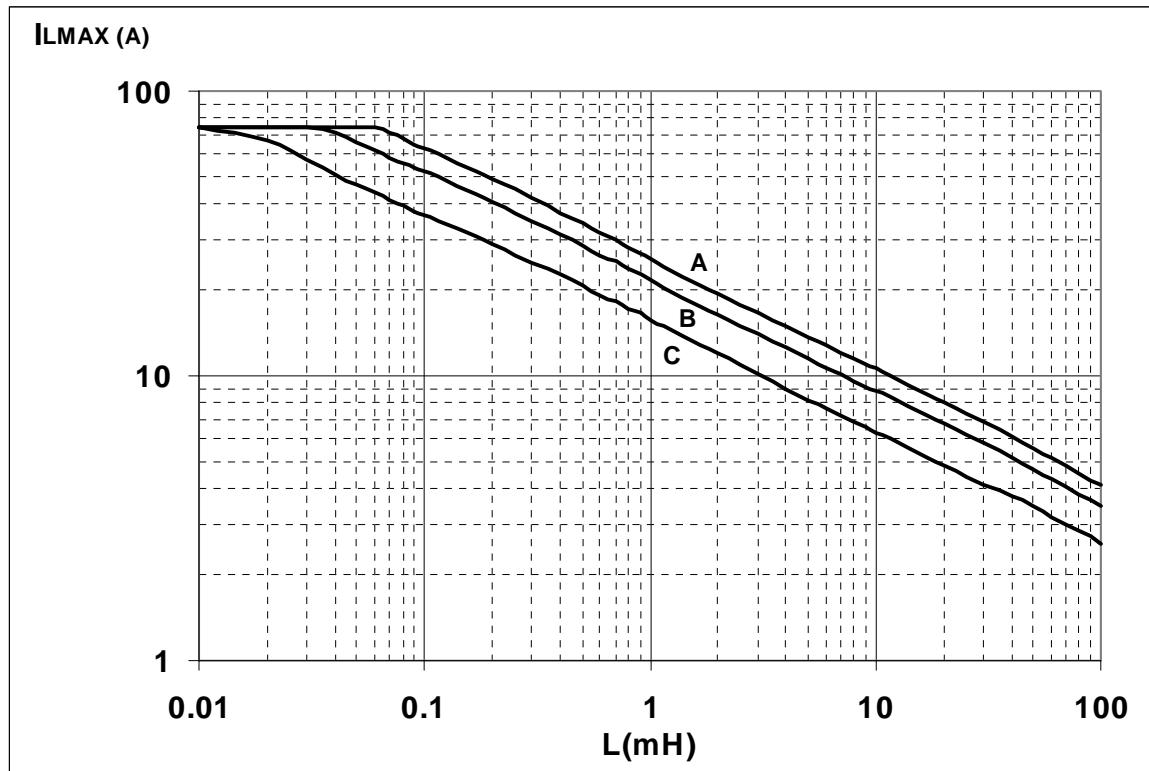

$V_{CC}=13.5\text{V}$

Values are generated with  $R_L=0\Omega$

In case of repetitive pulses,  $T_{Jstart}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

## SO-16L Maximum turn off current versus load inductance

A = Single Pulse at  $T_{j\text{start}}=150^\circ\text{C}$

B = Repetitive pulse at  $T_{j\text{start}}=100^\circ\text{C}$

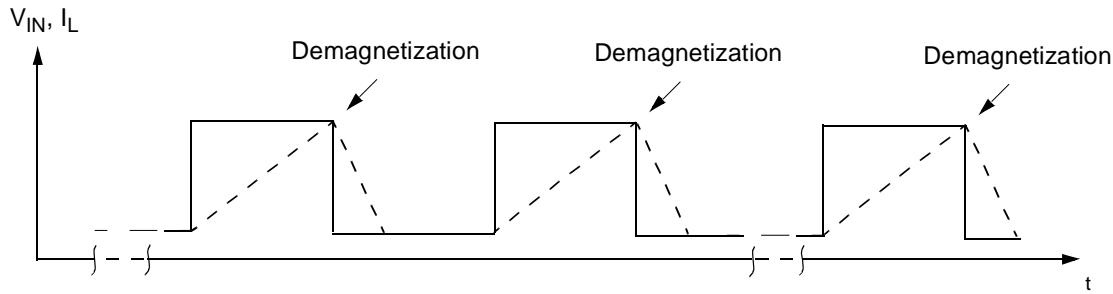

C = Repetitive Pulse at  $T_{j\text{start}}=125^\circ\text{C}$

Conditions:

$V_{CC}=13.5\text{V}$

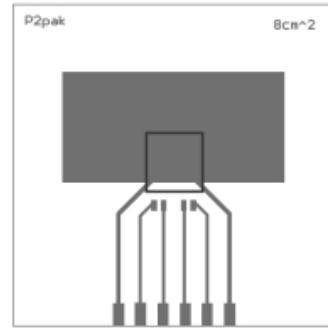

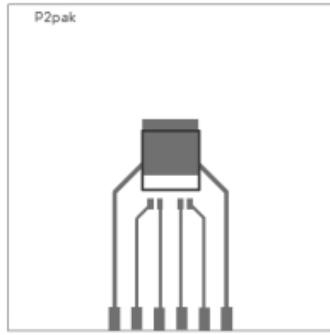

Values are generated with  $R_L=0\Omega$

In case of repetitive pulses,  $T_{j\text{start}}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.
