

## General Description

The AH287 is an integrated Hall sensor with output drivers for brushless DC motor application. This IC consists of two complementary outputs for motor's coil driving and has automatic lock protection and auto-restart function relatively. To avoid coil burning, rotor lock shutdown protection circuit shut down the output driver if the rotor blocked and then the automatic recovery circuit will try to restart the motor. This function repeats while rotor is blocked. Until the blocking is removed, the motor recovers running normally. In addition, the auto-restart time is flexible by adjusting the capacitance ( $C_{CT}$ ).

Placing the device in a variable magnetic field, if the magnetic flux density is larger than threshold  $B_{OP}$ , the DO is turned to sink and DOB is turned to drive. This output state is held until a magnetic flux density reversal falls below  $B_{RP}$ , causing DO to be turned to drive and DOB turned to sink.

This IC is available in TO-94 package.

## Features

- On-chip Hall Sensor
- Operating Voltage: 4V to 18V
- Maximum Output Current: 350mA (ave)
- Rotor-locked Protection
- Automatic Restart
- Adjustable Auto-restart Time
- Internal Band-gap Regulator for Temperature Compensation
- Operating Temperature:  $-20^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Low Profile TO-94 Package
- ESD Rating: 300V (Machine Model)

## Application

- Dual-coil Brushless DC Fan

Note 2:

1. The minimum startup voltage is 3.5V when D1 is disconnected.
2. The capacitances of  $C_{CT}$  and C2 are adjustable base on system requirements. The recommended values are as below:

$C_{CT}$	C2
1µF/9V~2.2µF/9V	1µF/50V~2.2µF/50V

**TWO PHASE HALL EFFECT LATCH WITH LOCKED PROTECTION AH287**
**Operating Diagram (Note 3)**

Note 3: The automatic restart circuit detects a motor lock condition and automatically turns off the output current. When the lock is cleared, the IC automatically restarts and allows the motor to run. In AH287, automatic restart is performed in the following manner. A motor lock condition is detected when the Hall signal stops switching. The output is ON when CT pin is being charged, and OFF when CT pin is being discharged.

$$T_{ON} = \frac{C * (V_{CL} - V_{CP})}{I_{CHG}} \text{ (Sec)}$$

$$T_{OFF} = \frac{C * (V_{CL} - V_{CP})}{I_{DHG}} \text{ (Sec)}$$

Output ON time (T<sub>ON</sub>) and OFF time (T<sub>OFF</sub>) are determined by C, the capacitance of the CT pin external capacitor.

V<sub>CL</sub> is the CT pin clamp voltage  
 V<sub>CP</sub> is the CT pin comparator voltage  
 I<sub>CHG</sub> is the CT pin charge current  
 I<sub>DHG</sub> is the CT pin discharge current
