General Description

TS432 series is a three-terminal adjustable shunt regulator with specified thermal stability. The output voltage may be set to any value between V_{ref} (approximately 1.24V) and 18V with two external resistors. TS432 series has a typical output impedance of 0.05Ω . Active output circuitry provides a very sharp turn-on characteristic, making TS432 series excellent replacement for zener diode in many applications.

Features

- Precision Reference Voltage
TS432 – $1.24V \pm 2\%$
TS432A – $1.24V \pm 1\%$
TS432B – $1.24V \pm 0.5\%$
- Minimum Cathode Current for Regulation: 20uA(typ.)
- Equivalent Full Range Temp. Coefficient: 50ppm/ °C
- Programmable Output Voltage up to 18V
- Fast Turn-On Response
- Sink Current Capability of 80uA to 100mA
- Low Dynamic Output Impedance: 0.05Ω
- Low Output Noise
- Halogen Free Available

Application

- Voltage Monitor
- Delay Timmer
- Constant –Current Source/Sink
- High-Current Shunt Regulator
- Crow Bar
- Over-Voltage / Under-Voltage Protection

Ordering Information

Part No.	Package	Packing
TS432xCT B0	TO-92	1Kpcs / Bulk
TS432xCT B0G	TO-92	1Kpcs / Bulk
TS432xCT A3	TO-92	2Kpcs / Ammo
TS432xCT A3G	TO-92	2Kpcs / Ammo
TS432xCX RF	SOT-23	3Kpcs / 7" Reel
TS432xCX RFG	SOT-23	3Kpcs / 7" Reel
TS432xCX5 RF	SOT-25	3Kpcs / 7" Reel
TS432xCX5 RFG	SOT-25	3Kpcs / 7" Reel

Note: Where **x** denotes voltage tolerance

Blank: $\pm 2\%$, **A:** $\pm 1\%$, **B:** $\pm 0.5\%$

"G" denotes for Halogen free products

Block Diagram

Absolute Maximum Rating (Ta = 25°C unless otherwise noted)

Parameter	Symbol	Limit	Unit
Cathode Voltage (Note 1)	V_{ka}	18	V
Continuous Cathode Current Range	I_k	100	mA
Reference Input Current Range	I_{ref}	3	mA
Power Dissipation	TO-92	0.625	W

Continuous Cathode Current Range	Ik	100	mA

Recommend Operating Condition

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Reference voltage	Vref	Vka = Vref, Ik=10mA (Figure 1) Ta=25°C	1.215	1.240	1.264	V
			1.227		1.252	
			1.233		1.246	
Deviation of reference input voltage	ΔVref	Vka = Vref, Ik=10mA Ta= full range (Figure 1)	--	10	25	mV
Ratio of change in Vref to change in cathode Voltage	ΔVref/ΔVka	Ika=10mA, Vka = 16V to Vref (Figure 2)	--	-1.0	-2.7	mV/V
Reference Input current	Iref	R1=10KΩ, R2= ∞ , Ika=10mA Ta= full range (Figure 2)	--	0.25	0.5	uA
Deviation of reference input current, over temp.	ΔIref	R1=10KΩ, R2= ∞ , Ika=10mA Ta= full range (Figure 2)	--	0.04	0.8	uA
Off-state Cathode Current	Ika(off)	Vref=0V (Figure 3), Vka=16V	--	0.125	0.5	uA
Dynamic Output Impedance	Zka	f<1KHz, Vka=Vref Ika=1mA to 100mA (Figure 1)	--	0.2	0.4	Ω
Minimum Operating Cathode Current	Ika(min)	Vka=Vref (Figure 1)	--	20	80	uA

* The deviation parameters ΔVref and ΔIref are defined as difference between the maximum value and minimum value obtained over the full operating ambient temperature range that applied.

* The average temperature coefficient of the reference input voltage, αVref is defined as:

$$\alpha V_{ref} \left(\frac{\text{ppm}}{^{\circ}\text{C}} \right) = \frac{\left(\frac{\Delta V_{ref}}{V_{ref}} \right) (T_A = 25^{\circ}\text{C}) \times 10^6}{\Delta T_A}$$

Where: **T2-T1** = full temperature change.

αVref can be positive or negative depending on whether Vref Min. or Vref Max occurs at the lower ambient temperature. Example: ΔVref=7.2mV and the slope is positive, Vref=1.241V at 25°C, ΔT=125°C

$$\alpha V_{ref} \left(\frac{\text{ppm}}{^{\circ}\text{C}} \right) = \frac{0.0072}{1.241} \times 10^6 = 46 \text{ ppm}/^{\circ}\text{C}$$

* The dynamic impedance ZKA is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

* When the device operating with two external resistors, R1 and R2, (refer to Figure 2) the total dynamic impedance of the circuit is given by:

$$|Z_{KA}'| = |Z_{KA}| \times \left(1 + \frac{R1}{R2} \right)$$

Test Circuits

Figure 1: $V_{KA} = V_{ref}$

Figure 2: $V_{KA} > V_{ref}$

Additional Information – Stability

When TS432 series is used as a shunt regulator, there are two options for selection of C_L , are recommended for optional stability:

- A) No load capacitance across the device, decouple at the load.
- B) Large capacitance across the device, optional decoupling at the load.

The reason for this is that TS432 series exhibits instability with capacitances in the range of 10nF to 1uF (approx.) at light cathode current up to 3mA (typ). The device is less stable the lower the cathode voltage has been set for. Therefore while the device will be perfectly stable operating at a cathode current of 10mA (approx.) with a 0.1uF capacitor across it, it will oscillate transiently during start up as the cathode current passes through the instability region. Select a very low capacitance, or alternatively a high capacitance (10uF) will avoid this issue altogether. Since the user will probably wish to have local decoupling at the load anyway, the most cost effective method is to use no capacitance at all directly across the device. PCB trace/via resistance and inductance prevent the local load decoupling from causing the oscillation during the transient start up phase.

Note: if the TS432 series is located right at the load, so the load decoupling capacitor is directly across it, then this capacitor will have to be $\leq 1nF$ or $\geq 10uF$.

Applications Examples

L.E.D. indicator is 'ON' when V_{in} is between the upper and lower limits,

$$\text{Lower limit} = \left(1 + \frac{R1}{R2} \right) V_{ref}$$

$$\text{Upper limit} = \left(1 + \frac{R3}{R4} \right) V_{ref}$$

Figure 4: Voltage Monitor

$$V_{out} = \left(1 + \frac{R1}{R2} \right) V_{ref}$$

$$V_{out(min)} = V_{ref} + 5.0 V$$

Typical Performance Characteristics

Test Circuit for Curve A

Test Circuit for Curve B, C and D

The areas under the curves represent conditions that may cause the device to oscillate. For curves B, C, and D, R_2 and V_+ were adjusted to establish the initial V_{KA} and I_{KA} conditions with $C_L=0$. V_{BATT} and C_L then were adjusted to determine the ranges of stability.
