

## MCF5485

TEPBGA-388

### MCF5485 Integrated Microprocessor Electrical Characteristics

This chapter contains electrical specification tables and reference timing diagrams for the MCF5485 microprocessor. This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications of the MCF5485.

#### MCF548X Family Features:

- ColdFire V4e Core
  - Limited superscalar V4 ColdFire processor core
  - Up to 200MHz peak internal core frequency (308 MIPS (Dhrystone 2.1) @ 200 MHz)
  - Harvard architecture
    - 32-Kbyte instruction cache
    - 32-Kbyte data cache
  - Memory Management Unit (MMU)
  - Floating point unit (FPU)
- Internal master bus (XLB) arbiter
- 32-bit double data rate (DDR) synchronous DRAM (SDRAM) controller
  - 66–133 MHz operation
- Version 2.2 peripheral component interconnect (PCI) bus
- Flexible multi-function external bus (FlexBus)
- Communications I/O subsystem
  - Intelligent 16 channel DMA controller, with support for
    - Dedicated DMA channels for receive and transmit on all subsystem peripheral interfaces
  - Up to two (2) 10/100 Mbps fast Ethernet controllers (FECs)
  - Universal serial bus (USB) version 2.0 device controller
  - Up to four (4) programmable serial controllers (PSCs) for UART, USART, modem, codec, and IrDA 1.1 interfaces
  - I<sup>2</sup>C peripheral interface
  - Two (2) controller area network 2.0B controllers
  - DMA Serial Peripheral Interface (DSPI)
- Optional Cryptography accelerator module
  - DES/3DES block cipher
  - AES block cipher
  - RC4 stream cipher
  - MD5/SHA-1/SHA-256/HMAC hashing
  - Random Number Generator
- 32-Kbyte system SRAM
- System integration unit (SIU)
  - Interrupt controller
  - Watchdog timer
  - Two (2) 32-bit slice timers
  - Up to four (4) 32-bit general-purpose timers
  - General-purpose I/O ports multiplexed with peripheral pins
- Debug and test features
  - ColdFire background debug mode (BDM) port
  - JTAG/ IEEE 1149.1 test access port
- PLL and clock generator
  - 30 to 66.67 MHz input frequency range

# 1 Maximum Ratings

Table 1 lists maximum and minimum ratings for supply and operating voltages and storage temperature. Operating outside of these ranges may cause erratic behavior or damage to the processor.

**Table 1. Absolute Maximum Ratings**

Rating	Symbol	Value	Units
External (I/O pads) supply voltage (3.3-V power pins)	$EV_{DD}$	-0.3 to +4.0	V
Internal logic supply voltage	$IV_{DD}$	-0.5 to +2.0	V
Memory (I/O pads) supply voltage (2.5-V power pins)	$SD V_{DD}$	-0.3 to +4.0 SDR Memory -0.3 to +2.8 DDR Memory	V
PLL supply voltage	$PLL V_{DD}$	-0.5 to +2.0	V
Internal logic supply voltage, input voltage level	$V_{in}$	-0.5 to +3.6	V
Storage temperature range	$T_{stg}$	-55 to +150	°C

## 2 Thermal Characteristics

### 2.1 Operating Temperatures

Table 2 lists junction and ambient operating temperatures.

**Table 2. Operating Temperatures**

Characteristic	Symbol	Value	Units
Maximum operating junction temperature	$T_j$	105	°C
Maximum operating ambient temperature	$T_{Amax}$	<85 <sup>1</sup>	°C
Minimum operating ambient temperature	$T_{Amin}$	- 40	°C

<sup>1</sup> This published maximum operating ambient temperature should be used only as a system design guideline. All device operating parameters are guaranteed only when the junction temperature lies within the specified range.

## 2.2 Thermal Resistance

Table 3 lists thermal resistance values.

**Table 3. Thermal Resistance**

Characteristic		Symbol	Value	Unit
388 pin TEPBGA — Junction to ambient, natural convection	Four layer board (2s2p)	$\theta_{JMA}$	20–22 <sup>1,2</sup>	°CW
Junction to ambient (@200 ft/min)	Four layer board (2s2p)	$\theta_{JMA}$	23 <sup>1,2</sup>	°CW
Junction to board	—	$\theta_{JB}$	15 <sup>3</sup>	°CW
Junction to case	—	$\theta_{JC}$	10 <sup>4</sup>	°CW
Junction to top of package	Natural convection	$\Psi_{jt}$	2 <sup>1,5</sup>	°CW

- <sup>1</sup> The  $\theta_{JA}$  and  $\Psi_{jt}$  parameters are simulated in accordance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of  $\theta_{JA}$  and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the  $\Psi_{jt}$  parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.
- <sup>2</sup> Per JEDEC JESD51-6 with the board horizontal.
- <sup>3</sup> Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
- <sup>4</sup> Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
- <sup>5</sup> Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

## 3 DC Electrical Specifications

Table 4 lists DC electrical operating temperatures. This table is based on an operating voltage of  $EV_{DD} = 3.3 V_{DC} \pm 0.3 V_{DC}$  and  $IV_{DD}$  of  $1.5 \pm 0.07 V_{DC}$ .

**Table 4. DC Electrical Specifications**

Characteristic	Symbol	Min	Max	Units
External (I/O pads) operation voltage range	$EV_{DD}$	3.0	3.6	V
Memory (I/O pads) operation voltage range (DDR Memory)	$SD V_{DD}$	2.30	2.70	V
Internal logic operation voltage range <sup>1</sup>	$IV_{DD}$	1.43	1.58	V
PLL Analog operation voltage range <sup>1</sup>	$PLL V_{DD}$	1.43	1.58	V
USB oscillator operation voltage range	$USB\_OSV_{DD}$	3.0	3.6	V
USB digital logic operation voltage range	$USBV_{DD}$	3.0	3.6	V
USB PHY operation voltage range	$USB\_PHYV_{DD}$	3.0	3.6	V
USB oscillator analog operation voltage range	$USB\_OSCAV_{DD}$	1.43	1.58	V
USB PLL operation voltage range	$USB\_PLLV_{DD}$	1.43	1.58	V
Input high voltage SSTL 3.3V/2.5V <sup>2</sup>	$V_{IH}$	$V_{REF} + 0.3$	$SD V_{DD} + 0.3$	V

Table 4. DC Electrical Specifications (continued)

Characteristic	Symbol	Min	Max	Units
Input low voltage SSTL 3.3V/2.5V <sup>2</sup>	$V_{IL}$	$V_{SS} - 0.3$	$V_{REF} - 0.3$	V
Input high voltage 3.3V I/O pins	$V_{IH}$	$0.7 \times EV_{DD}$	$EV_{DD} + 0.3$	V
Input low voltage 3.3V I/O pins	$V_{IL}$	$V_{SS} - 0.3$	$0.35 \times EV_{DD}$	V
Output high voltage $I_{OH} = 8 \text{ mA}, 16 \text{ mA}, 24 \text{ mA}$	$V_{OH}$	2.4	—	V
Output low voltage $I_{OL} = 8 \text{ mA}, 16 \text{ mA}, 24 \text{ mA}$ <sup>5</sup>	$V_{OL}$	—	0.5	V
Capacitance <sup>3</sup> , $V_{in} = 0 \text{ V}, f = 1 \text{ MHz}$	$C_{IN}$	—	TBD	pF

<sup>1</sup>  $IV_{DD}$  and PLL  $V_{DD}$  should be at the same voltage. PLL  $V_{DD}$  should have a filtered input. Please see Figure 2 for an example circuit. There are three PLL  $V_{DD}$  inputs. A filter circuit should be used on each PLL  $V_{DD}$  input.

<sup>2</sup> This specification is guaranteed by design and is not 100% tested.

<sup>3</sup> Capacitance  $C_{IN}$  is periodically sampled rather than 100% tested.

## 4 Hardware Design Considerations

### 4.1 PLL Power Filtering

To further enhance noise isolation, an external filter is strongly recommended for PLL analog  $V_{DD}$  pins. The filter shown in Figure 2 should be connected between the board  $V_{DD}$  and the PLL  $V_{DD}$  pins. The resistor and capacitors should be placed as close to the dedicated PLL  $V_{DD}$  pin as possible.

Figure 2. System PLL  $V_{DD}$  Power Filter

### 4.2 Supply Voltage Sequencing and Separation Cautions

Figure 3 shows situations in sequencing the I/O  $V_{DD}$  ( $EV_{DD}$ ), SDRAM  $V_{DD}$  ( $SD V_{DD}$ ), PLL  $V_{DD}$  ( $PLL V_{DD}$ ), and Core  $V_{DD}$  ( $IV_{DD}$ ).

## NOTES:

1. IV<sub>DD</sub> should not exceed EV<sub>DD</sub>, SD V<sub>DD</sub> or PLL V<sub>DD</sub> by more than 0.4V at any time, including power-up.
2. Recommended that IV<sub>DD</sub>/PLL V<sub>DD</sub> should track EV<sub>DD</sub>/SD V<sub>DD</sub> up to 0.9V, then separate for completion of ramps.
3. Input voltage must not be greater than the supply voltage (EV<sub>DD</sub>, SD V<sub>DD</sub>, IV<sub>DD</sub>, or PLL V<sub>DD</sub>) by more than 0.5V at any time, including during power-up.
4. Use 1 microsecond or slower rise time for all supplies.

**Figure 3. Supply Voltage Sequencing and Separation Cautions**

The relationship between SD V<sub>DD</sub> and EV<sub>DD</sub> is non-critical during power-up and power-down sequences. SD V<sub>DD</sub> (2.5V or 3.3V) and EV<sub>DD</sub> are specified relative to IV<sub>DD</sub>.

## 4.2.1 Power Up Sequence

If EV<sub>DD</sub>/SD V<sub>DD</sub> are powered up with the IV<sub>DD</sub> at 0V, the sense circuits in the I/O pads cause all pad output drivers connected to the EV<sub>DD</sub>/SD V<sub>DD</sub> to be in a high impedance state. There is no limit on how long after EV<sub>DD</sub>/SD V<sub>DD</sub> powers up before IV<sub>DD</sub> must power up. IV<sub>DD</sub> should not lead the EV<sub>DD</sub>, SD V<sub>DD</sub>, or PLL V<sub>DD</sub> by more than 0.4V during power ramp up or there is high current in the internal ESD protection diodes. The rise times on the power supplies should be slower than 1 microsecond to avoid turning on the internal ESD protection clamp diodes.

The recommended power up sequence is:

1. Use 1 microsecond or slower rise time for all supplies.
2. IV<sub>DD</sub>/PLL V<sub>DD</sub> and EV<sub>DD</sub>/SD V<sub>DD</sub> should track up to 0.9V, then separate for the completion of ramps with EV<sub>DD</sub>/SD V<sub>DD</sub> going to the higher external voltages. One way to accomplish this is to use a low drop-out voltage regulator.

## 4.2.2 Power Down Sequence

If IV<sub>DD</sub>/PLL V<sub>DD</sub> are powered down first, sense circuits in the I/O pads cause all output drivers to be in a high impedance state. There is no limit on how long after IV<sub>DD</sub> and PLL V<sub>DD</sub> power down before EV<sub>DD</sub> or SD V<sub>DD</sub> must power down. IV<sub>DD</sub> should not lag EV<sub>DD</sub>, SD V<sub>DD</sub>, or PLL V<sub>DD</sub> going low by more than 0.4V during power down or there is undesired high current in the ESD protection diodes. There are no requirements for the fall times of the power supplies.

The recommended power down sequence is:

3. Drop IV<sub>DD</sub>/PLL V<sub>DD</sub> to 0V
4. Drop EV<sub>DD</sub>/SD V<sub>DD</sub> supplies

## 4.3 General USB Layout Guidelines

### 4.3.1 USB D+ and D- High-Speed Traces

- High speed clock and the USB D+ and USB D- differential pair should be routed first.
- Route USB D+ and USB D- signals on the top layer of the board.
- The trace width and spacing of the USB D+ and USB D- signals should be such that the differential impedance is  $90\Omega$ .
- Route traces over continuous planes (power and ground)—they should not pass over any power/ground plane slots or anti-etch. When placing connectors, make sure the ground plane clear-outs around each pin have ground continuity between all pins.
- Maintain the parallelism (skew matched) between USB D+ and USB D-. These traces should be the same overall length.
- Do not route USB D+ and USB D- traces under oscillators or parallel to clock traces and/or data buses. Minimize the lengths of high speed signals that run parallel to the USB D+ and USB D- pair. Maintain a minimum 50mil spacing to clock signals.
- Keep USB D+ and USB D- traces as short as possible.
- Route USB D+, USB D-, and USB VBUS signals with a minimum amount of vias and corners. Use  $45^\circ$  turns.
- Stubs should be avoided as much as possible. If they cannot be avoided, stubs should be no greater than 200mils.

### 4.3.2 USB VBUS Traces

Connecting the USB VBUS pin directly to the 5V VBUS signal from the USB connector can cause long-term reliability problems in the ESD network of the processor. Therefore, use of an external voltage divider for VBUS is recommended. Figure 4 and Figure 5 depict possible connections for VBUS. Point A, marked in each figure, is where a 5V version of VBUS should connect. Point B, marked in each figure, is where a 3.3V version of VBUS should connect to the USB VBUS pin on the device.

Figure 4. Preferred VBUS Connections

Figure 5. Alternate VBUS Connections

### 4.3.3 USB Receptacle Connections

It is recommended to connect the shield and the ground pin of the B USB receptacle for upstream ports to the board ground plane. The ground pin of the A USB receptacles for downstream ports should also be connected to the board ground plane, but industry practice varies widely on the connection of the shield of the A USB receptacles to other system grounds. Take precautions for control of ground loops between hosts and self-powered USB devices through the cable shield.

## 4.4 USB Power Filtering

To minimize noise, an external filter is required for each of the USB power pins. The filter shown in [Figure 6](#) should be connected between the board  $EV_{DD}$  or  $IV_{DD}$  and each of the USB  $V_{DD}$  pins.

- The resistor and capacitors should be placed as close to the dedicated USB  $V_{DD}$  pin as possible.
- A separate filter circuit should be included for each USB  $V_{DD}$  pin, a total of five circuits.
- All traces should be as low impedance as possible, especially ground pins to the ground plane.
- The filter for USB\_PHYVDD to VSS should be connected to the power and ground planes, respectively, not fingers of the planes.
- In addition to keeping the filter components for the USB\_PLLVDD as close as practical to the body of the processor as previously mentioned, special care should be taken to avoid coupling switching power supply noise or digital switching noise onto the portion of that supply between the filter and the processor.
- The capacitors for C2 in the table below should be rated X5R or better due to temperature performance.

**Figure 6. USB  $V_{DD}$  Power Filter**

### NOTE

In addition to the above filter circuitry, a 0.01 F capacitor is also recommended in parallel with those shown.

[Table 5](#) lists the resistor values and supply voltages to be used in the circuit for each of the USB  $V_{DD}$  pins.

**Table 5. USB Filter Circuit Values**

USB $V_{DD}$ Pin	Nominal Voltage	R1 ( $\Omega$ )	C1 ( $\mu$ F)	C2 ( $\mu$ F)
USBVDD (Bias generator supply)	3.3V	10	10	0.1
USB_PHYVDD (Main transceiver supply)	3.3V	0	10	0.1
USB_PLLVDD (PLL supply)	1.5V	10	1	0.1
USB_OSCVDD (Oscillator supply)	3.3V	0	10	0.1
USB_OSCAVDD (Oscillator analog supply)	1.5V	0	10	0.1

## Output Driver Capability and Loading

### 4.4.1 Bias Resistor

The USBRBIAS resistor should be placed as close to the dedicated USB 2.0 pins as possible. The tolerance should be  $\pm 1\%$ .

Figure 7. USBRBIAS Connection

## 5 Output Driver Capability and Loading

Table 6 lists values for drive capability and output loading.

Table 6. I/O Driver Capability

Signal	Drive Capability	Output Load ( $C_L$ )
SDRAMC (SDADDR[12:0], SDDATA[31:0], $\overline{RAS}$ , $\overline{CAS}$ , SDDM[3:0], $\overline{SDWE}$ , SDBA[1:0])	24 mA	15 pF
SDRAMC DQS and clocks (SDDQS[3:0], SDRDQS, SDCLK[1:0], $\overline{SDCLK}$ [1:0], SDCKE)	24 mA	15 pF
SDRAMC chip selects ( $\overline{SDCS}$ [3:0])	24 mA	15 pF
FlexBus (AD[31:0], $\overline{FBCS}$ [5:0], ALE, $R/\overline{W}$ , $\overline{BE}/\overline{BWE}$ [3:0], $\overline{OE}$ )	16 mA	30 pF
FEC ( $E_nMIO$ , $E_nMDC$ , $E_nTXEN$ , $E_nTXD$ [3:0], $E_nTXER$ )	8 mA	15 pF
Timer (TOUT[3:0])	8 mA	50 pF
FlexCAN (CANTX)	8 mA	30 pF
$\overline{DACK}$ [1:0]	8 mA	30 pF
PSC ( $PSC_nTXD$ [3:0], $\overline{PSC_nRTS}/PSC_nFSYNC$ ,	8 mA	30 pF
DSPI (DSPISOUT, DSPICS0/SS, DSPICS[2:3], DSPICS5/PCSS)	24 mA	50 pF
PCI (PCIAD[31:0], PCIBG[4:1], PCIBG0/PCIREQOUT, PCIDEVSEL, PCICXBE[3:0], PCIFRM, PCIPERR, PCIRESET, PCISERR, PCISTOP, PCIPAR, PCITRDY, PCIIRDY)	16 mA	50 pF
I2C (SCL, SDA)	8 mA	50 pF
BDM (PSTCLK, PSTDDATA[7:0], DSO/TDO,	8 mA	25 pF
RSTO	8 mA	50 pF

## 6 PLL Timing Specifications

The specifications in [Table 7](#) are for the CLKIN pin.

**Table 7. Clock Timing Specification**

Num	Characteristic	Min	Max	Units
C1	Cycle time	20	40	ns
C2	Rise time (20% of VDD to 80% of VDD)	—	2	ns
C3	Fall time (80% of VDD to 20% of VDD)	—	2	ns
C4	Duty cycle (at 50% of VDD)	40	60	%

**Figure 8. Input Clock Timing Diagram**

[Table 8](#) shows the supported PLL encodings.

**Table 8. MCF548X Divide Ratio Encodings**

AD[12:8] <sup>1</sup>	Clock Ratio	CLKIN—PCI and FlexBus Frequency Range (MHz)	Internal XLB, SDRAM Bus, and PSTCLK Frequency Range (MHz)	Core Frequency Range (MHz)
00011	1:2	41.6–50.0	83.33–100	166.66–200
00101	1:2	25.0–41.5	50.0–83.0 <sup>2</sup>	100.0–166.66
01111	1:4	25	100	200

<sup>1</sup> All other values of AD[12:8] are reserved.

<sup>2</sup> DDR memories typically have a minimum speed of 83 MHz. Some vendors specify down to 75 MHz. Check with memory component specifications to verify.

[Figure 9](#) correlates CLKIN, internal bus, and core clock frequencies for the 1x–4x multipliers.

**Figure 9. CLKIN, Internal Bus, and Core Clock Ratios**

# 7 Reset Timing Specifications

Table 9 lists specifications for the reset timing parameters shown in Figure 10

**Table 9. Reset Timing Specification**

Num	Characteristic	50 MHz CLKIN		Units
		Min	Max	
R1 <sup>1</sup>	Valid to CLKIN (setup)	8	—	ns
R2	CLKIN to invalid (hold)	1.0	—	ns
R3	$\overline{\text{RSTI}}$ to invalid (hold)	1.0	—	ns

<sup>1</sup>  $\overline{\text{RSTI}}$  and FlexBus data lines are synchronized internally. Setup and hold times must be met only if recognition on a particular clock is required.

Figure 10 shows reset timing for the values in Table 9.

**NOTE:**

Mode selects are registered on the rising clock edge before the cycle in which  $\overline{\text{RSTI}}$  is recognized as being negated.

**Figure 10. Reset Timing**

# 8 FlexBus

A multi-function external bus interface called FlexBus is provided on the MCF5482 with basic functionality to interface to slave-only devices up to a maximum bus frequency of 66 MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices, a simple chip-select based interface can be used. The FlexBus interface has six general purpose chip-selects ( $\overline{\text{FBCS}}[5:0]$ ). Chip-select  $\overline{\text{FBCS}}0$  can be dedicated to boot ROM access and can be programmed to be byte (8 bits), word (16 bits), or longword (32 bits) wide. Control signal timing is compatible with common ROM / flash memories.

## 8.1 FlexBus AC Timing Characteristics

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the system clock.

**Table 10. FlexBus AC Timing Specifications**

Num	Characteristic	Min	Max	Unit	Notes
—	Frequency of Operation	25	50	Mhz	<sup>1</sup>
FB1	Clock Period (CLKIN)	20	40	ns	<sup>2</sup>
FB2	Address, Data, and Control Output Valid (AD[31:0], $\overline{\text{FBCS}}[5:0]$ , R/W, ALE, TSIZ[1:0], $\overline{\text{BE}}/\overline{\text{BWE}}[3:0]$ , $\overline{\text{OE}}$ , and $\overline{\text{TBST}}$ )	—	7.0	ns	<sup>3</sup>
FB3	Address, Data, and Control Output Hold ((AD[31:0], $\overline{\text{FBCS}}[5:0]$ , R/W, ALE, TSIZ[1:0], $\overline{\text{BE}}/\overline{\text{BWE}}[3:0]$ , $\overline{\text{OE}}$ , and $\overline{\text{TBST}}$ )	1	—	ns	<sup>3, 4</sup>
FB4	Data Input Setup	3.5	—	ns	
FB5	Data Input Hold	0	—	ns	
FB6	Transfer Acknowledge ( $\overline{\text{TA}}$ ) Input Setup	4	—	ns	
FB7	Transfer Acknowledge ( $\overline{\text{TA}}$ ) Input Hold	0	—	ns	
FB8	Address Output Valid (PCIAD[31:0])	—	7.0	ns	<sup>5</sup>
FB9	Address Output Hold (PCIAD[31:0])	0	—	ns	<sup>5</sup>

<sup>1</sup> The frequency of operation is the same as the PCI frequency of operation. The MCF548X supports a single external reference clock (CLKIN). This signal defines the frequency of operation for FlexBus and PCI.

<sup>2</sup> Max cycle rate is determined by CLKIN and how the user has the system PLL configured.

<sup>3</sup> Timing for chip selects only applies to the  $\overline{\text{FBCS}}[5:0]$  signals. Please see [Section 10.1, “DDR SDRAM AC Timing Characteristics”](#) for  $\overline{\text{SDCS}}[3:0]$  timing.

<sup>4</sup> The FlexBus supports programming an extension of the address hold. Please consult the MCF548X specification manual for more information.

<sup>5</sup> These specs are used when the PCIAD[31:0] signals are configured as 32-bit, non-muxed FlexBus address signals.

Figure 11. FlexBus Read Timing

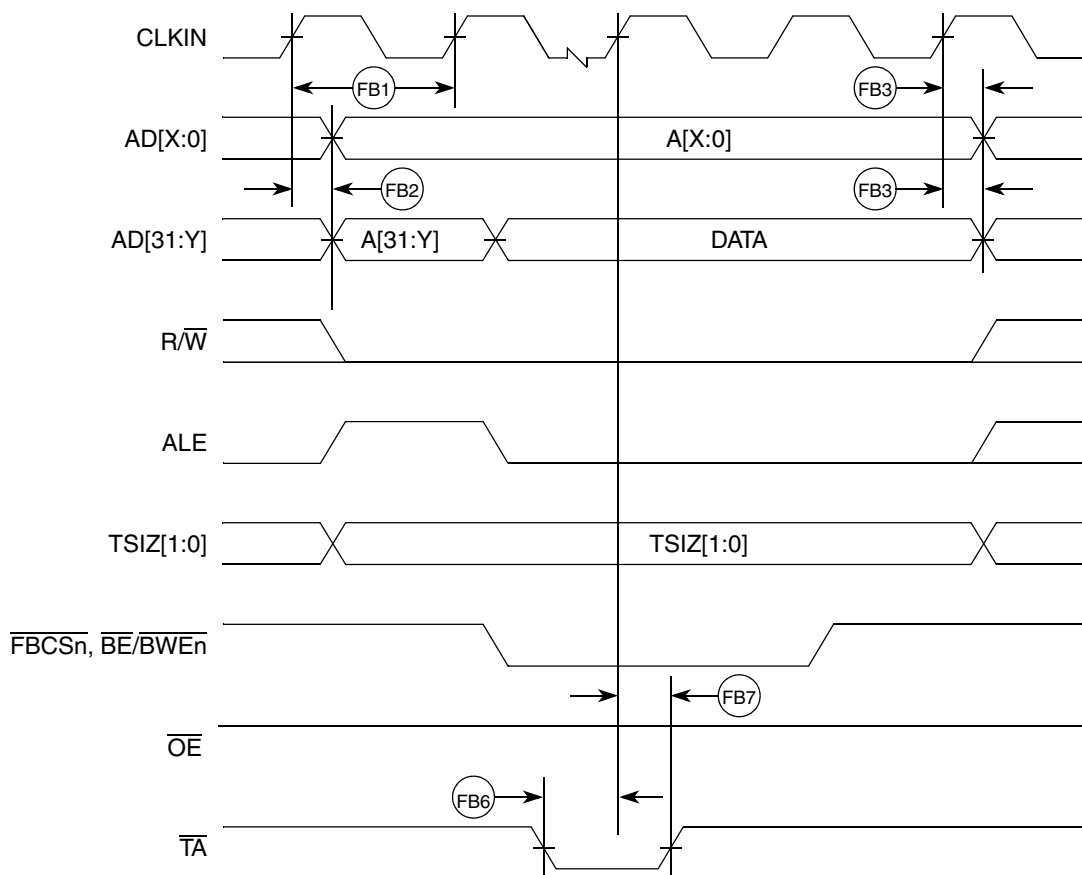

Figure 12. FlexBus Write Timing

## 9 SDRAM Bus

The SDRAM controller supports accesses to main SDRAM memory from any internal master. It supports standard SDRAM or double data rate (DDR) SDRAM, but it does not support both at the same time. The SDRAM controller uses SSTL2 and SSTL3 I/O drivers. Both SSTL drive modes are programmable for Class I or Class II drive strength.

## 10 SDR SDRAM AC Timing Characteristics

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the memory bus clock, when operating in SDR mode on write cycles and relative to SDR\_DQS on read cycles. The MCF5485 SDRAM controller is a DDR controller with an SDR mode. Because it supports DDR, a DQS pulse must remain supplied to the MCF5485 for each data beat of an SDR read. The MCF5485 accomplishes this by asserting a signal called SDR\_DQS during read cycles. During board design, adhere to the following guidelines and specs with regard to the SDR\_DQS signal and its usage.

Table 11. SDR Timing Specifications

Symbol	Characteristic	Min	Max	Unit	Notes
—	Frequency of Operation	0	133	Mhz	1
SD1	Clock Period ( $t_{CK}$ )	7.52	12	ns	2
SD2	Clock Skew ( $t_{SK}$ )	—	TBD	—	—
SD3	Pulse Width High ( $t_{CKH}$ )	0.45	0.55	SDCLK	3

Table 11. SDR Timing Specifications

Symbol	Characteristic	Min	Max	Unit	Notes
SD4	Pulse Width Low ( $t_{CKL}$ )	0.45	0.55	SDCLK	4
SD5	Address, CKE, CAS, RAS, WE, BA, CS - Output Valid ( $t_{CMV}$ )	—	$0.5 \times \text{SDCLK} + 1.0\text{ns}$	ns	
SD6	Address, CKE, CAS, RAS, WE, BA, CS - Output Hold ( $t_{CMH}$ )	2.0	—	ns	
SD7	SDRDQS Output Valid ( $t_{DQSOV}$ )	—	Self timed	ns	5
SD8	SDDQS[3:0] input setup relative to SDCLK ( $t_{DQSiS}$ )	$0.25 \times \text{SDCLK}$	$0.40 \times \text{SDCLK}$	ns	6
SD9	SDDQS[3:0] input hold relative to SDCLK ( $t_{DQSiH}$ )	Does not apply. 0.5 SDCLK fixed width.			7
SD10	Data Input Setup relative to SDCLK (reference only) ( $t_{DiS}$ )	$0.25 \times \text{SDCLK}$	—	ns	8
SD11	Data Input Hold relative to SDCLK (reference only) ( $t_{DiH}$ )	1.0	—	ns	
SD12	Data and Data Mask Output Valid ( $t_{DV}$ )	—	$0.75 \times \text{SDCLK} + 0.500\text{ns}$	ns	
SD13	Data and Data Mask Output Hold ( $t_{DH}$ )	1.5		ns	

<sup>1</sup> The frequency of operation is 2x or 4x the CLKIN frequency of operation. The MCF548X supports a single external reference clock (CLKIN). This signal defines the frequency of operation for FlexBus and PCI, but SDRAM clock operates at the same frequency as the internal bus clock. Please see the PLL chapter of the *MCF548X Reference Manual* for more information on setting the SDRAM clock rate.

<sup>2</sup> SDCLK is one SDRAM clock in (ns).

<sup>3</sup> Pulse width high plus pulse width low cannot exceed min and max clock period.

<sup>4</sup> Pulse width high plus pulse width low cannot exceed min and max clock period.

<sup>5</sup> SDR\_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This is a guideline only. Subtle variation from this guideline is expected. SDR\_DQS pulses only during a read cycle and one pulse occurs for each data beat.

<sup>6</sup> SDR\_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This spec is a guideline only. Subtle variation from this guideline is expected. SDR\_DQS pulses only during a read cycle and one pulse occurs for each data beat.

<sup>7</sup> The SDR\_DQS pulse is designed to be 0.5 clock in width. The timing of the rising edge is most important. The falling edge does not affect the memory controller.

<sup>8</sup> Because a read cycle in SDR mode continues using the DQS circuit within the MCF548X, it is most critical that the data valid window be centered 1/4 clk after the rising edge of DQS. Ensuring that this happens results in successful SDR reads. The input setup spec is provided as guidance.

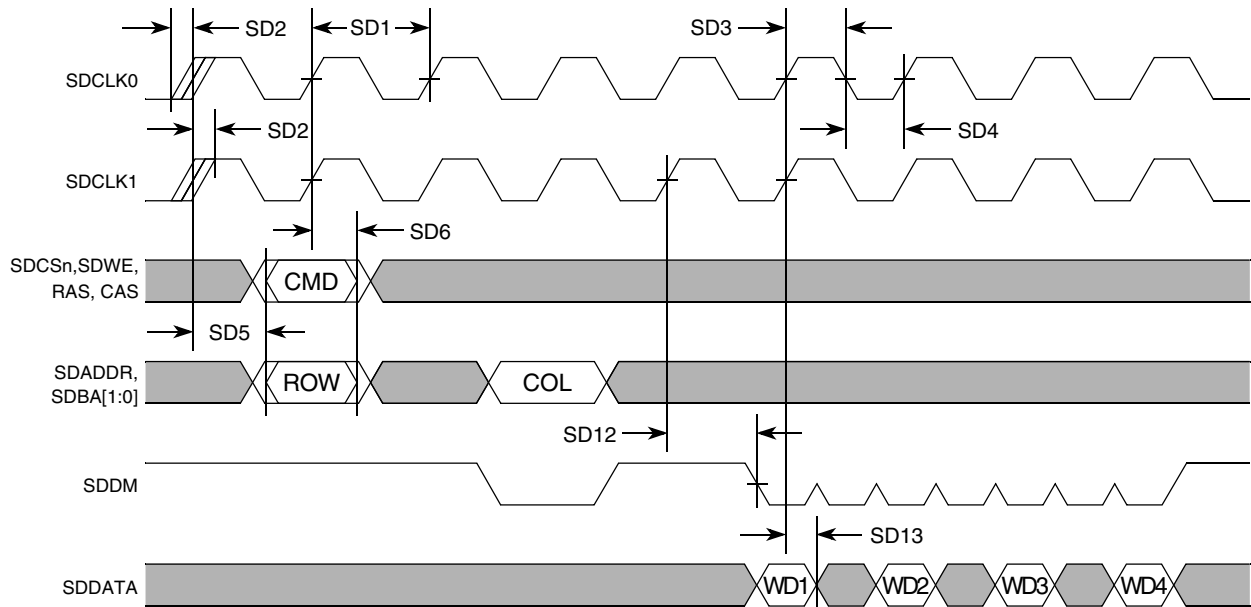

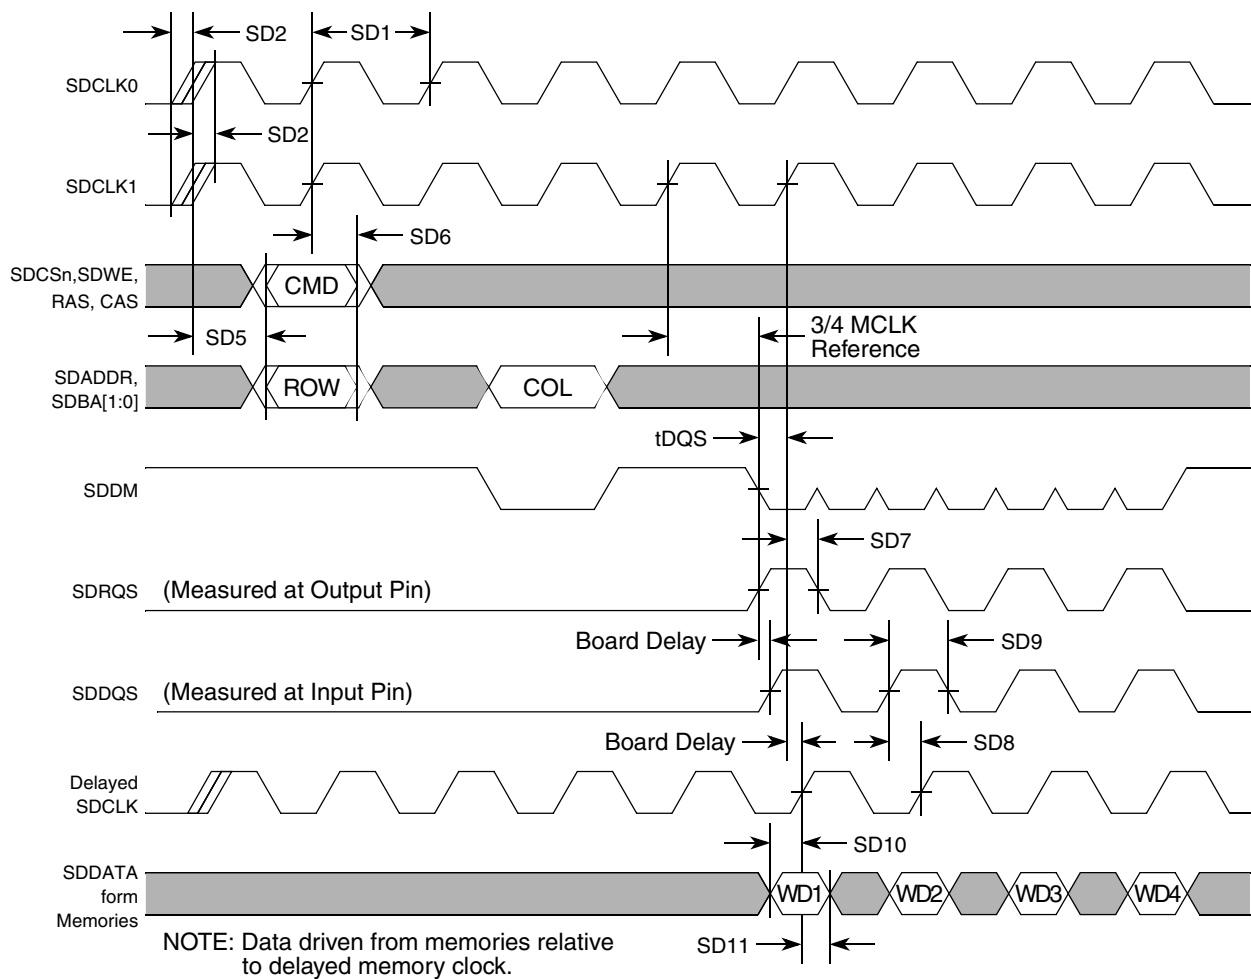

Figure 13. SDR Write Timing

NOTE: Data driven from memories relative to delayed memory clock.

Figure 14. SDR Read Timing

## 10.1 DDR SDRAM AC Timing Characteristics

When using the DDR SDRAM controller, the following timing numbers must be followed to properly latch or drive data onto the memory bus. All timing numbers are relative to the four DQS byte lanes.

Table 12 shows the DDR clock crossover specifications.

**Table 12. DDR Clock Crossover Specifications**

Symbol	Characteristic	Min	Max	Unit
$V_{MP}$	Clock output mid-point voltage	1.05	1.45	V
$V_{OUT}$	Clock output voltage level	-0.3	SD_VDD + 0.3	V
$V_{ID}$	Clock output differential voltage (peak to peak swing)	0.7	SD_VDD + 0.6	V
$V_{IX}$	Clock crossing point voltage <sup>1</sup>	1.05	1.45	V

<sup>1</sup> The clock crossover voltage is only guaranteed when using the highest drive strength option for the SDCLK[1:0] and  $\overline{SDCLK}$ [1:0] signals.

**Figure 15. DDR Clock Timing Diagram**

**Table 13. DDR Timing Specifications**

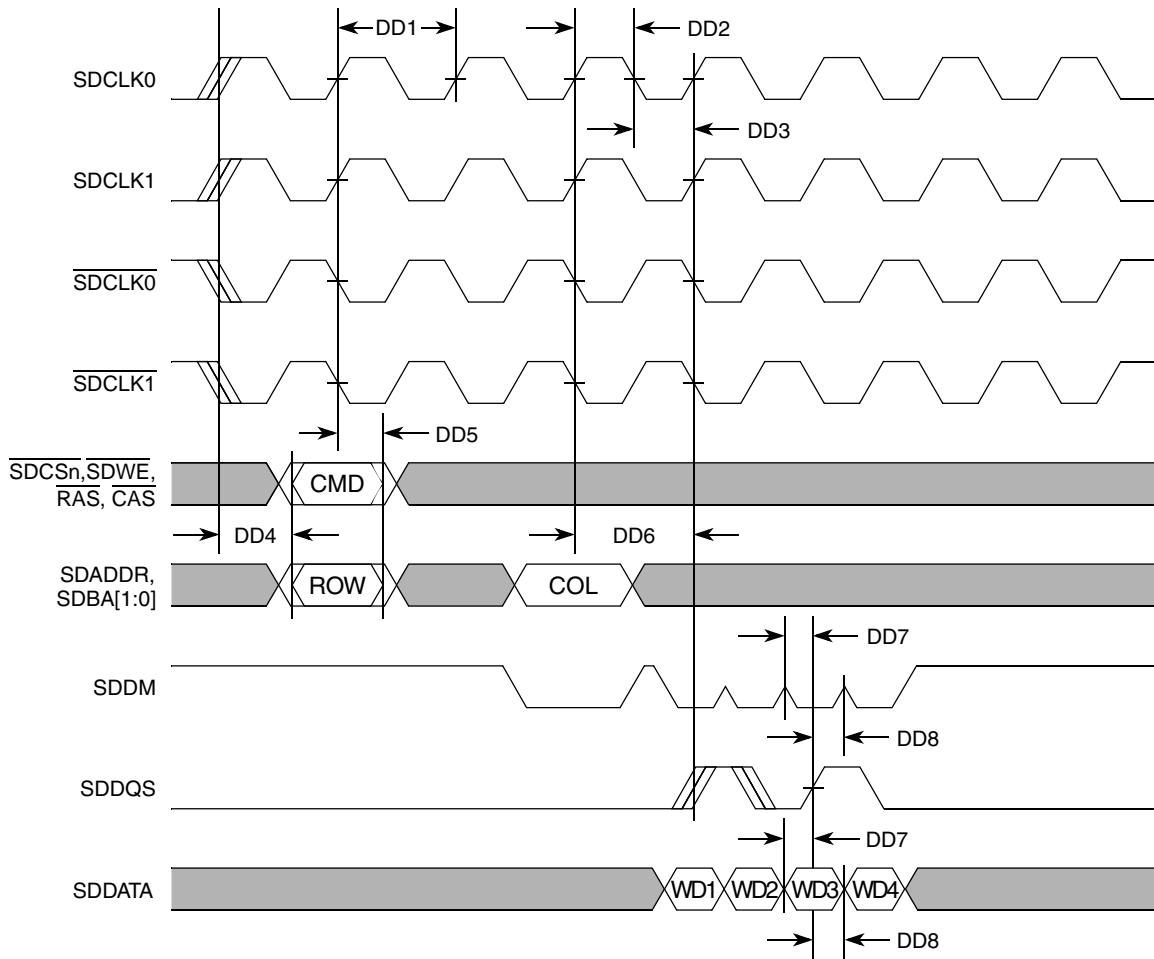

Symbol	Characteristic	Min	Max	Unit	Notes
—	Frequency of Operation	50 <sup>1</sup>	133	MHz	2
DD1	Clock Period ( $t_{CK}$ )	7.52	12	ns	3
DD2	Pulse Width High ( $t_{CKH}$ )	0.45	0.55	SDCLK	4
DD3	Pulse Width Low ( $t_{CKL}$ )	0.45	0.55	SDCLK	5
DD4	Address, SDCKE, $\overline{CAS}$ , $\overline{RAS}$ , $\overline{WE}$ , SDBA, $\overline{SDCS}$ —Output Valid ( $t_{CMV}$ )	—	$0.5 \times \text{SDCLK} + 1.0 \text{ ns}$	ns	6
DD5	Address, SDCKE, $\overline{CAS}$ , $\overline{RAS}$ , $\overline{WE}$ , SDBA, $\overline{SDCS}$ —Output Hold ( $t_{CMH}$ )	2.0	—	ns	—
DD6	Write Command to first DQS Latching Transition ( $t_{DQSS}$ )	—	1.25	SDCLK	—
DD7	Data and Data Mask Output Setup (DQ→DQS) Relative to DQS (DDR Write Mode) ( $t_{QS}$ )	1.0	—	ns	7 8
DD8	Data and Data Mask Output Hold (DQS→DQ) Relative to DQS (DDR Write Mode) ( $t_{QH}$ )	1.0	—	ns	9
DD9	Input Data Skew Relative to DQS (Input Setup) ( $t_{IS}$ )	—	1	ns	10
DD10	Input Data Hold Relative to DQS ( $t_{IH}$ )	$0.25 \times \text{SDCLK} + 0.5\text{ns}$	—	ns	11
DD11	DQS falling edge to SDCLK rising (output setup time) ( $t_{DSS}$ )	0.5	—	ns	—
DD12	DQS falling edge from SDCLK rising (output hold time) ( $t_{DSH}$ )	0.5	—	ns	—

Table 13. DDR Timing Specifications (continued)

Symbol	Characteristic	Min	Max	Unit	Notes
DD13	DQS input read preamble width ( $t_{RPRE}$ )	0.9	1.1	SDCLK	—
DD14	DQS input read postamble width ( $t_{RPST}$ )	0.4	0.6	SDCLK	—
DD15	DQS output write preamble width ( $t_{WPRE}$ )	0.25	—	SDCLK	—
DD16	DQS output write postamble width ( $t_{WPST}$ )	0.4	0.6	SDCLK	—

- <sup>1</sup> DDR memories typically have a minimum speed specification of 83 MHz. Check with memory component specifications to verify.
- <sup>2</sup> The frequency of operation is 2x or 4x the CLKIN frequency of operation. The MCF548X supports a single external reference clock (CLKIN). This signal defines the frequency of operation for FlexBus and PCI, but SDRAM clock operates at the same frequency as the internal bus clock. Please see the reset configuration signals description in the “Signal Descriptions” chapter within the *MCF548x Reference Manual*.
- <sup>3</sup> SDCLK is one memory clock in (ns).
- <sup>4</sup> Pulse width high plus pulse width low cannot exceed max clock period.
- <sup>5</sup> Pulse width high plus pulse width low cannot exceed max clock period.
- <sup>6</sup> Command output valid should be 1/2 the memory bus clock (SDCLK) plus some minor adjustments for process, temperature, and voltage variations.
- <sup>7</sup> This specification relates to the required input setup time of today’s DDR memories. SDDATA[31:24] is relative to SDDQS3, SDDATA[23:16] is relative to SDDQS2, SDDATA[15:8] is relative to SDDQS1, and SDDATA[7:0] is relative SDDQS0.
- <sup>8</sup> The first data beat is valid before the first rising edge of SDDQS and after the SDDQS write preamble. The remaining data beats is valid for each subsequent SDDQS edge.
- <sup>9</sup> This specification relates to the required hold time of today’s DDR memories. SDDATA[31:24] is relative to SDDQS3, SDDATA[23:16] is relative to SDDQS2, SDDATA[15:8] is relative to SDDQS1, and SDDATA[7:0] is relative SDDQS0.
- <sup>10</sup> Data input skew is derived from each SDDQS clock edge. It begins with a SDDQS transition and ends when the last data line becomes valid. This input skew must include DDR memory output skew and system level board skew (due to routing or other factors).
- <sup>11</sup> Data input hold is derived from each SDDQS clock edge. It begins with a SDDQS transition and ends when the first data line becomes invalid.

**SDR SDRAM AC Timing Characteristics**

**Figure 16. DDR Write Timing**

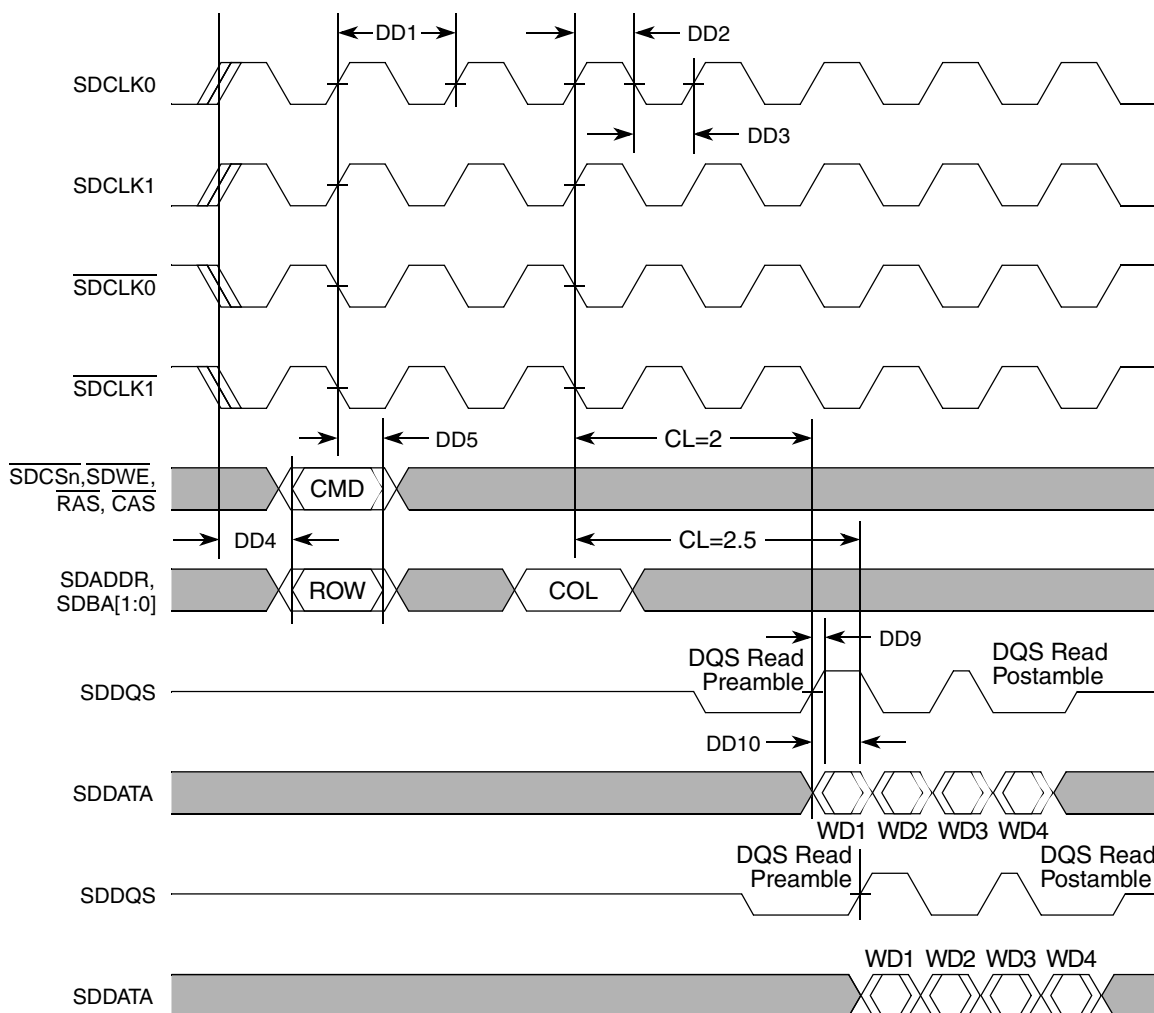

Figure 17. DDR Read Timing

## 11 PCI Bus

The PCI bus on the MCF5485 is PCI 2.2 compliant. The following timing numbers are mostly from the PCI 2.2 spec. Please refer to the PCI 2.2 spec for a more detailed timing analysis.

Table 14. PCI Timing Specifications

Num	Characteristic	Min	Max	Unit	Notes
—	Frequency of Operation	25	50	MHz	1
P1	Clock Period ( $t_{CK}$ )	20	40	ns	2
P2	Address, Data, and Command ( $33 < \text{PCI} \leq 50 \text{ Mhz}$ )—Input Setup ( $t_{IS}$ )	3.0	—	ns	—
P3	Address, Data, and Command ( $0 < \text{PCI} \leq 33 \text{ Mhz}$ )—Input Setup ( $t_{IS}$ )	7.0	—	ns	—
P4	Address, Data, and Command ( $33\text{--}50 \text{ Mhz}$ )—Output Valid ( $t_{DV}$ )	—	6.0	ns	3
P5	Address, Data, and Command ( $0\text{--}33 \text{ Mhz}$ ) - Output Valid ( $t_{DV}$ )	—	11.0	ns	—
P6	PCI signals ( $0\text{--}50 \text{ Mhz}$ ) - Output Hold ( $t_{DH}$ )	0	—	ns	4

**Table 14. PCI Timing Specifications (continued)**

Num	Characteristic	Min	Max	Unit	Notes
P7	PCI signals (0–50 Mhz) - Input Hold ( $t_{IH}$ )	0	—	ns	5
P8	PCI REQ/GNT ( $33 < \text{PCI} \leq 50\text{Mhz}$ ) - Output valid ( $t_{DV}$ )	—	6	ns	6
P9	PCI REQ/GNT ( $0 < \text{PCI} \leq 33\text{Mhz}$ ) - Output valid ( $t_{DV}$ )	—	12	ns	—
P10	PCI REQ/GNT ( $33 < \text{PCI} \leq 50\text{Mhz}$ ) - Input Setup ( $t_{IS}$ )	—	5	ns	—
P11	PCI REQ ( $0 < \text{PCI} \leq 33\text{Mhz}$ ) - Input Setup ( $t_{IS}$ )	12	—	ns	—
P12	PCI GNT ( $0 < \text{PCI} \leq 33\text{Mhz}$ ) - Input Setup ( $t_{IS}$ )	10	—	ns	—

- <sup>1</sup> Please see the reset configuration signals description in the “Signal Descriptions” chapter within the *MCF548x Reference Manual*. Also specific guidelines may need to be followed when operating the system PLL below certain frequencies.
- <sup>2</sup> Max cycle rate is determined by CLKIN and how the user has the system PLL configured.
- <sup>3</sup> All signals defined as PCI based signals. Does not include PTP (point-to-point) signals.
- <sup>4</sup> PCI 2.2 spec does not require an output hold time. Although the MCF548X may provide a slight amount of hold, it is not required or guaranteed.
- <sup>5</sup> PCI 2.2 spec requires zero input hold.
- <sup>6</sup> These signals are defined at PTP (Point-to-point) in the PCI 2.2 spec.

**Figure 18. PCI Timing**

## 12 Fast Ethernet AC Timing Specifications

### 12.1 MII/7-WIRE Interface Timing Specs

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the EMAC\_10\_100 I/O signals.

The following timing specs meet the requirements for MII and 7-Wire style interfaces for a range of transceiver devices. If this interface is used with a specific transceiver device, the timing specs may be altered to match that specific transceiver.

**Table 15. MII Receive Signal Timing**

Num	Characteristic	Min	Max	Unit
M1	RXD[3:0], RXDV, RXER to RXCLK setup	5	—	ns
M2	RXCLK to RXD[3:0], RXDV, RXER hold	5	—	ns
M3	RXCLK pulse width high	35%	65%	RXCLK period
M4	RXCLK pulse width low	35%	65%	RXCLK period

**Figure 19. MII Receive Signal Timing Diagram**

## 12.2 MII Transmit Signal Timing

Table 16. MII Transmit Signal Timing

Num	Characteristic	Min	Max	Unit
M5	TXCLK to TXD[3:0], TXEN, TXER invalid	0	—	ns
M6	TXCLK to TXD[3:0], TXEN, TXER valid	—	25	ns
M7	TXCLK pulse width high	35%	65%	TXCLK period
M8	TXCLK pulse width low	35%	65%	TXCLK period

Figure 20. MII Transmit Signal Timing Diagram

## 12.3 MII Async Inputs Signal Timing (CRS, COL)

Table 17. MII Transmit Signal Timing

Num	Characteristic	Min	Max	Unit
M9	CRS, COL minimum pulse width	1.5	—	TX_CLK period

Figure 21. MII Async Inputs Timing Diagram

## 12.4 MII Serial Management Channel Timing (MDIO, MDC)

Table 18. MII Serial Management Channel Signal Timing

Num	Characteristic	Min	Max	Unit
M10	MDC falling edge to MDIO output invalid (min prop delay)	0	—	ns
M11	MDC falling edge to MDIO output valid (max prop delay)	—	25	ns
M12	MDIO (input) to MDC rising edge setup	10	—	ns
M13	MDIO (input) to MDC rising edge hold	0	—	ns

**Table 18. MII Serial Management Channel Signal Timing**

Num	Characteristic	Min	Max	Unit
M14	MDC pulse width high	40%	60%	MDC period
M15	MDC pulse width low	40%	60%	MDC period

**Figure 22. MII Serial Management Channel Timing Diagram**

## 13 General Timing Specifications

Table 19 lists timing specifications for the GPIO, PSC, FlexCAN,  $\overline{DREQ}$ ,  $\overline{DACK}$ , and external interrupts.

**Table 19. General AC Timing Specifications**

Name	Characteristic	Min	Max	Unit
G1	CLKIN high to signal output valid	—	2	PSTCLK
G2	CLKIN high to signal invalid (output hold)	0	—	ns
G3	Signal input pulse width	2	—	PSTCLK

## 14 I<sup>2</sup>C Input/Output Timing Specifications

Table 20 lists specifications for the I<sup>2</sup>C input timing parameters shown in Figure 23.

**Table 20. I<sup>2</sup>C Input Timing Specifications Between SCL and SDA**

Num	Characteristic	Min	Max	Units
I1	Start condition hold time	2	—	Bus clocks
I2	Clock low period	8	—	Bus clocks
I3	SCL/SDA rise time ( $V_{IL} = 0.5\text{ V}$ to $V_{IH} = 2.4\text{ V}$ )	—	1	mS
I4	Data hold time	0	—	ns
I5	SCL/SDA fall time ( $V_{IH} = 2.4\text{ V}$ to $V_{IL} = 0.5\text{ V}$ )	—	1	mS

**Table 20. I<sup>2</sup>C Input Timing Specifications Between SCL and SDA (continued)**

Num	Characteristic	Min	Max	Units
I6	Clock high time	4	—	Bus clocks
I7	Data setup time	0	—	ns
I8	Start condition setup time (for repeated start condition only)	2	—	Bus clocks
I9	Stop condition setup time	2	—	Bus clocks

Table 21 lists specifications for the I<sup>2</sup>C output timing parameters shown in Figure 23.

**Table 21. I<sup>2</sup>C Output Timing Specifications Between SCL and SDA**

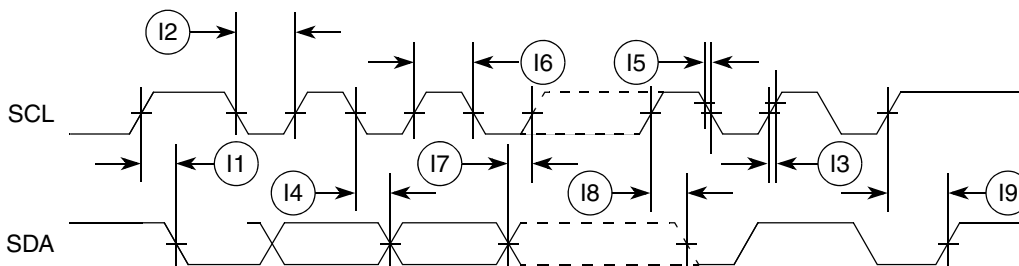

Num	Characteristic	Min	Max	Units
I1 <sup>1</sup>	Start condition hold time	6	—	Bus clocks
I2 <sup>1</sup>	Clock low period	10	—	Bus clocks
I3 <sup>2</sup>	SCL/SDA rise time ( $V_{IL} = 0.5\text{ V}$ to $V_{IH} = 2.4\text{ V}$ )	—	—	$\mu\text{S}$
I4 <sup>1</sup>	Data hold time	7	—	Bus clocks
I5 <sup>3</sup>	SCL/SDA fall time ( $V_{IH} = 2.4\text{ V}$ to $V_{IL} = 0.5\text{ V}$ )	—	3	ns
I6 <sup>1</sup>	Clock high time	10	—	Bus clocks
I7 <sup>1</sup>	Data setup time	2	—	Bus clocks
I8 <sup>1</sup>	Start condition setup time (for repeated start condition only)	20	—	Bus clocks
I9 <sup>1</sup>	Stop condition setup time	10	—	Bus clocks

<sup>1</sup> Output numbers depend on the value programmed into the IFDR; an IFDR programmed with the maximum frequency (IFDR = 0x20) results in minimum output timings as shown in Table 21. The I<sup>2</sup>C interface is designed to scale the actual data transition time to move it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed into the IFDR; however, the numbers given in Table 21 are minimum values.

<sup>2</sup> Because SCL and SDA are open-collector-type outputs, which the processor can only actively drive low, the time SCL or SDA take to reach a high level depends on external signal capacitance and pull-up resistor values.

<sup>3</sup> Specified at a nominal 50-pF load.

Figure 23 shows timing for the values in Table 20 and Table 21.

**Figure 23. I<sup>2</sup>C Input/Output Timings**

# 15 JTAG and Boundary Scan Timing

Table 22. JTAG and Boundary Scan Timing

Num	Characteristics <sup>1</sup>	Symbol	Min	Max	Unit
J1	TCLK Frequency of Operation	$f_{JCYC}$	DC	10	MHz
J2	TCLK Cycle Period	$t_{JCYC}$	2	—	$t_{CK}$
J3	TCLK Clock Pulse Width	$t_{JCW}$	15.15	—	ns
J4	TCLK Rise and Fall Times	$t_{JCRF}$	0.0	3.0	ns
J5	Boundary Scan Input Data Setup Time to TCLK Rise	$t_{BSDST}$	5.0	—	ns
J6	Boundary Scan Input Data Hold Time after TCLK Rise	$t_{BSDHT}$	24.0	—	ns
J7	TCLK Low to Boundary Scan Output Data Valid	$t_{BSDV}$	0.0	15.0	ns
J8	TCLK Low to Boundary Scan Output High Z	$t_{BSDZ}$	0.0	15.0	ns
J9	TMS, TDI Input Data Setup Time to TCLK Rise	$t_{TAPBST}$	5.0	—	ns
J10	TMS, TDI Input Data Hold Time after TCLK Rise	$t_{TAPBHT}$	10.0	—	ns
J11	TCLK Low to TDO Data Valid	$t_{TDODV}$	0.0	20.0	ns
J12	TCLK Low to TDO High Z	$t_{TDODZ}$	0.0	15.0	ns
J13	$\overline{TRST}$ Assert Time	$t_{TRSTAT}$	100.0	—	ns
J14	$\overline{TRST}$ Setup Time (Negation) to TCLK High	$t_{TRSTST}$	10.0	—	ns

<sup>1</sup> MTMOD is expected to be a static signal. Hence, it is not associated with any timing
