MN1380 Series

CMOS LSIs for Voltage Detection

■ Overview

The MN1380 series are elements that monitor the power supply voltage supplied to microcomputers and other LSI systems and issue reset signals for initializing the system after the power is first applied or for preventing runaway operation when the supply voltage fluctuates.

There is a choice of three output types: CMOS output, N-channel open drain output, and inverted CMOS output. There are also three package types: M, TO-92, and a mini type for surface mounting.

Choose the ideal element for your application from the series' wide selection of detection ranks (17 ranks between 2.0 and 4.9 volts), output types, and package types.
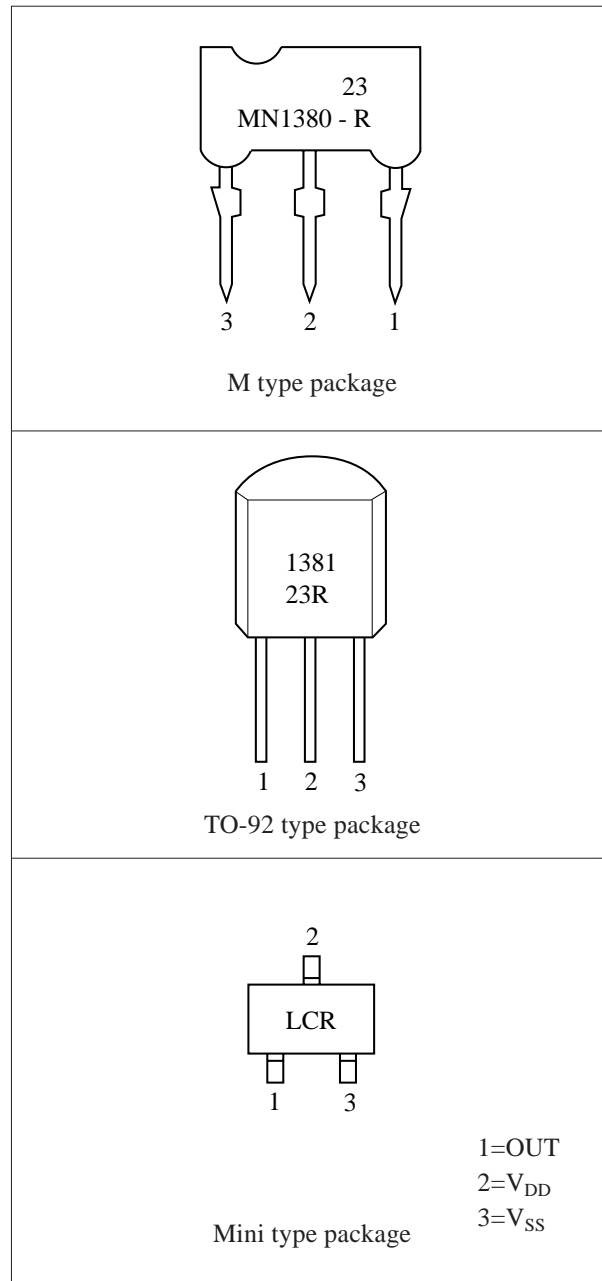

■ Features

- Three-pin element requiring no adjustment
- Wide selection of detection ranks (17 ranks between 2.0 and 4.9 volts)
- Highly precise detection voltage
- Detection voltage with hysteresis characteristic
  ΔVD = 50 mV for ranks C to K
  ΔVD = 100 mV for ranks L to U
- Low current consumption: I_{DD} = 1μA (typ.) for V_{DD} = 5 V
- Low fluctuation in detection voltage with temperature (typ. 1 mV/°C)
- Wide selection of output types: CMOS output, N-channel open drain output, and inverted CMOS output
- Wide selection of package types: M, TO-92, and a mini type for surface mounting.

■ Applications

- Battery checkers
- Power outage detectors
- Level discriminators
- Memory backup systems
- Microcomputer reset circuits
- Reset circuits for other electronic circuits

■ MN1380 Series Naming Conventions

The MN1380 series offers a wide selection of detection ranks, output types, package types, and packaging. All combinations use the following naming conventions. When ordering, be sure to give the correct part number using these naming conventions.

MN13801–R (TA)

Winding direction for tape packaging
(TA) ...... Tape packaging for TO-92 type package
(TX) ...... Embossed tape packing for mini type package
(TW) ..... Embossed tape packing for mini type package
For further details, see the package specifications.

■ Description of Operation

Figure 1. Description of Operation

Notes

1: Output cannot be specified for power supply voltages under 1.5 V because operation is not guaranteed for that range.

2: V_{DL}: Detection voltage for drop in power supply voltage

   V_{DH}: Detection voltage for rise in power supply voltage

   t_{OL} : Time lag between the time that the power supply voltage reaches the detection voltage (V_{DL} or V_{DH}) and the time that the output pin (OUT) goes to "L" level.

   t_{OH} : Time lag between the time that the power supply voltage reaches the detection voltage (V_{DL} or V_{DH}) and the time that the output pin (OUT) goes to "H" level.

3: These characteristics for the N-channel open drain output are when a load resistor is connected between the OUT and V_{DD} pins.

■ Application Circuit Example

Connect resistors, capacitors, and the like only to the output pin on the MN1380 series element. Note that connecting them to the Power source pins changes V_{DH}, V_{DL}, and ΔVD.
