

### FEATURES SUMMARY

- PRECISION MONITORING OF 3V, 3.3V, and 5V SUPPLY VOLTAGES
- OPEN DRAIN  $\overline{RST}$  OUTPUT
- 140ms RESET PULSE WIDTH (MIN)
- LOW SUPPLY CURRENT - 6 $\mu$ A (TYP)
- GUARANTEED  $\overline{RST}$  ASSERTION DOWN TO  $V_{CC} = 1.0V$
- OPERATING TEMPERATURE: -40°C to 85°C (Industrial Grade)
- LEAD-FREE, SMALL SOT23 PACKAGE

## SUMMARY DESCRIPTION

The STM1001 MICROPROCESSOR RESET Circuit is a low-power supervisory device used to monitor power supplies. It performs a single function: asserting a reset signal whenever the  $V_{CC}$

supply voltage drops below a preset value and keeping it asserted until  $V_{CC}$  has risen above the preset threshold for a minimum period of time ( $t_{rec}$ ).

Figure 4. Block Diagram

Note: 1. Open Drain

Figure 5. Hardware Hookup

Note: 1.  $\overline{RST}$  output requires pull-up resistor.

### OPERATION

#### Reset Output

The STM1001 MICROPROCESSOR RESET CIRCUIT asserts a reset signal to the MCU whenever  $V_{CC}$  goes below the reset threshold ( $V_{RST}$ ).  $\overline{RST}$  is guaranteed valid down to  $V_{CC} = 1V$  ( $0^\circ$  to  $70^\circ C$ ).

During power-up, once  $V_{CC}$  exceeds the reset threshold an internal timer keeps  $\overline{RST}$  low for the reset time-out period,  $t_{rec}$ . After this interval,  $\overline{RST}$  returns high.

If  $V_{CC}$  drops below the reset threshold,  $\overline{RST}$  goes low. Each time  $\overline{RST}$  is asserted, it stays low for at least the reset time-out period. Any time  $V_{CC}$  goes below the reset threshold, the internal timer clears. The reset timer starts when  $V_{CC}$  returns above the reset threshold. The active-low reset ( $\overline{RST}$ ) is an open drain output.

#### Negative-Going $V_{CC}$ Transients

The STM1001 is relatively immune to negative-going  $V_{CC}$  transients (glitches). Figure 11., page 7 shows typical transient duration versus reset comparator overdrive (for which the STM1001 will NOT generate a reset pulse). The graph was generated using a negative pulse applied to  $V_{CC}$ , starting at 0.5V above the actual reset threshold

and ending below it by the magnitude indicated (comparator overdrive). The graph indicates the maximum pulse width a negative  $V_{CC}$  transient can have without causing a reset pulse. As the magnitude of the transient increases (further below the threshold), the maximum allowable pulse width decreases. Any combination of duration and overdrive which lies under the curve will NOT generate a reset signal. Typically, a  $V_{CC}$  transient that goes 100mV below the reset threshold and lasts 20 $\mu$ s or less will not cause a reset pulse. A 0.1 $\mu$ F bypass capacitor mounted as close as possible to the  $V_{CC}$  pin provides additional transient immunity.

#### Valid $\overline{RST}$ Output Down to $V_{CC} = 0V$

When  $V_{CC}$  falls below 1V, the  $\overline{RST}$  output no longer sinks current, but becomes an open circuit. In most systems this is not a problem, as most MCUs do not operate below 1V. However, in applications where  $\overline{RST}$  output must be valid down to 0V, a pull-down resistor may be added to hold the  $\overline{RST}$  output low. This resistor must be large enough to not load the  $\overline{RST}$  output, and still be small enough to pull the output to ground. A 100K $\Omega$  resistor is recommended.

**TYPICAL OPERATING CHARACTERISTICS**

**Note:** Typical values are at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5\text{V}$  for L/M versions,  $V_{CC} = 3.3\text{V}$  for T/S versions, and  $V_{CC} = 3.0\text{V}$  for R versions.

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 2. Absolute Maximum Ratings**

Symbol	Parameter	Value	Unit
$T_{STG}$	Storage Temperature ( $V_{CC}$ Off)	-55 to 150	°C
$T_{SLD}^{(1)}$	Lead Solder Temperature for 10 seconds	260	°C
$V_{IO}$	Input or Output Voltage	-0.3 to $V_{CC} + 0.3$	V
$V_{CC}$	Supply Voltage	-0.3 to 7.0	V
$I_O$	Output Current	20	mA
$P_D$	Power Dissipation	320	mW

Note: 1. Reflow at peak temperature of 255°C to 260°C for < 30 seconds (total thermal budget not to exceed 180°C for between 90 to 150 seconds).

## DC AND AC PARAMETERS

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measurement

Conditions summarized in Table 3, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

**Table 3. Operating and AC Measurement Conditions**

Parameter	STM1001	Unit
$V_{CC}$ Supply Voltage	1.0 to 5.5	V
Ambient Operating Temperature ( $T_A$ )	-40 to 85	°C
Input Rise and Fall Times	$\leq 5$	ns
Input Pulse Voltages	0.2 to $0.8V_{CC}$	V
Input and Output Timing Ref. Voltages	0.3 to $0.7V_{CC}$	V

**Figure 12. AC Testing Input/Output Waveforms**

Table 4. DC and AC Characteristics

Sym	Alternative	Description	Test Condition <sup>(1)</sup>	Min	Typ	Max	Unit			
V <sub>CC</sub>		Operating Voltage	T <sub>A</sub> = -40 to +85°C	1.2		5.5	V			
			T <sub>A</sub> = 0 to +70°C	1.0		5.5	V			
I <sub>CC</sub>		V <sub>CC</sub> Supply Current	V <sub>CC</sub> < 3.6V		5.5	10	μA			
			V <sub>CC</sub> < 5.5V		7	15	μA			
I <sub>LO</sub>		Open Drain Reset Output Leakage Current	V <sub>CC</sub> > V <sub>RST</sub> , Reset not asserted	-1		+1	μA			
V <sub>OL</sub>		$\overline{\text{RST}}$ Output Low Voltage	STM1001R/S/T only, I <sub>OL</sub> = 1.2mA V <sub>CC</sub> = V <sub>RST</sub> (min)			0.3	V			
			STM1001L/M only, I <sub>OL</sub> = 3.2mA V <sub>CC</sub> = V <sub>RST</sub> (min)			0.4	V			
V <sub>OL</sub>		$\overline{\text{RST}}$ Output Low Voltage	I <sub>OL</sub> = 50μA; V <sub>CC</sub> > 1.0V			0.3	V			
<b>RESET Thresholds</b>										
V <sub>RST</sub>		Reset Threshold	STM1001L	25°C	4.56	4.63	4.70	V		
				-40 to 85°C	4.50		4.75	V		
			STM1001M	25°C	4.31	4.38	4.45	V		
				-40 to 85°C	4.25		4.50	V		
			STM1001T	25°C	3.04	3.08	3.11	V		
				-40 to 85°C	3.00		3.15	V		
			STM1001S	25°C	2.89	2.93	2.96	V		
				-40 to 85°C	2.85		3.00	V		
			STM1001R	25°C	2.59	2.63	2.66	V		
				-40 to 85°C	2.55		2.70	V		
					V <sub>RST</sub> Temperature Coefficient	V <sub>CC</sub> = 3.3V		45		ppm/ C
					V <sub>CC</sub> to $\overline{\text{RST}}$ Delay	V <sub>CC</sub> = V <sub>RST</sub> to (V <sub>RST</sub> - 100mV)	STM1001L/M	40		μs
		STM1001R/S/T	20				μs			
	t <sub>rec</sub>	$\overline{\text{RST}}$ Pulse Width		140	210	280	ms			

Note: 1. Valid for Ambient Operating Temperature: T<sub>A</sub> = -40 to 85°C; V<sub>CC</sub> = 1.2V to 5.5V (except where noted).

2. "Glitches" of 100ns or less typically will not generate a RESET pulse.
