

Rad-hard adjustable negative voltage regulator

Features

- 3 A low dropout voltage
- Optional overtemperature and overcurrent protection
- Adjustable overcurrent limitation
- Load short circuit monitoring
- Adjustable output voltage
- Inhibit (ON/OFF) TTL-compatible control
- Programmable output short-circuit current limitation
- Remote sensing operation
- Rad-hard: sustains 300 krad in Mil-1019.7 at High & ELDRS low dose rate conditions
- Heavy ions, SEL immune at 68 MeV/cm²/mg LET ions; able to Sustain 2x10¹⁴ protons/cm²

Description

The RHFL7913A adjustable is a high performance Rad hard negative voltage regulator. Available in FLAT-16 and new SMD5C hermetic ceramic packages, it is specifically intended for space and harsh radiation environments. It provides exceptional electrical performances, high speed and low dropout voltage.

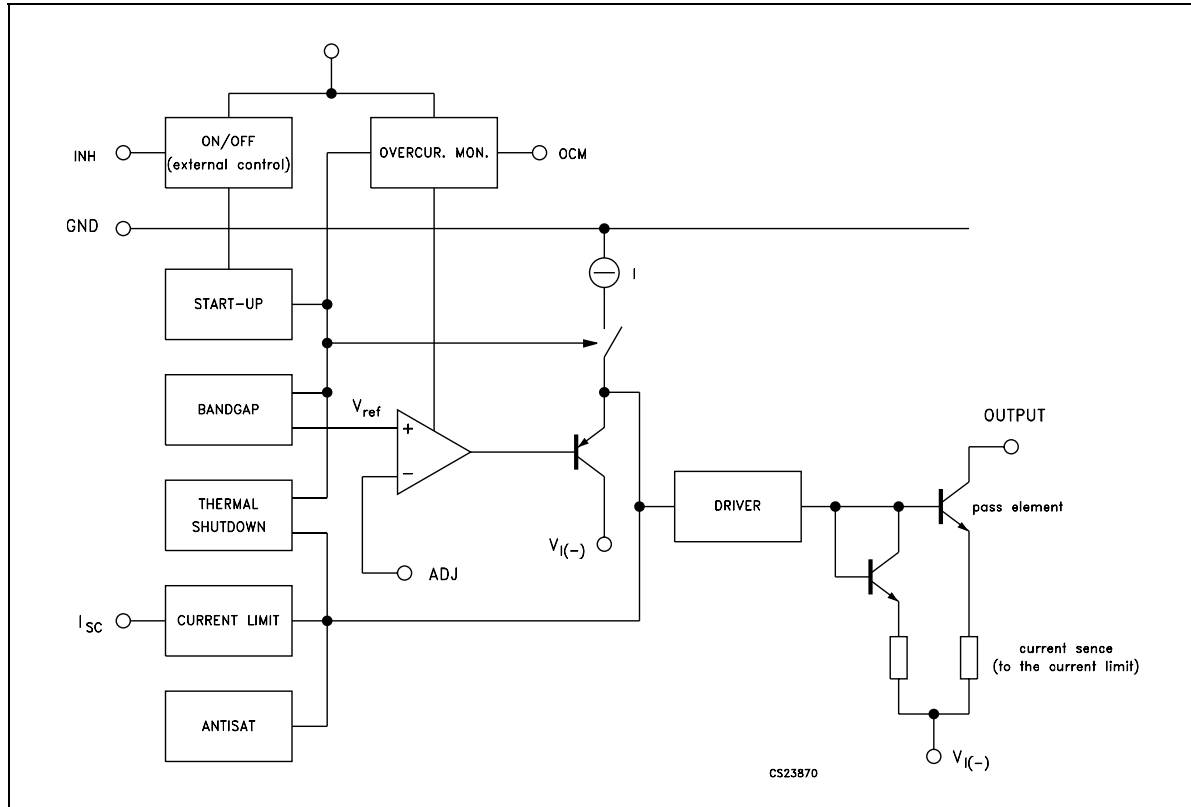

Input supply ranges from -3 V to -12 V. It also provide logical control / monitor functions (inhibit, output monitor, short-circuit control) from/to external positive voltage signals, while the entire RHFL7913A adjustable analog functions are biased at negative voltages with respect of ground pin. The device is QML-V qualified with SMD 5962-02532.

1. These values are guaranteed by design. For each application it's strongly recommended to comply with the maximum current limit of the package used.

5 Device description

The RHFL7913A adjustable contains a NPN-type power element controlled by signal resulting from amplified comparison between internal temperature compensated band-gap cell and the fraction of the desired output voltage value, generated by an external resistor divider bridge. The NPN structure allows access to lower drop out levels because its base current can be routed to ground pin and not to output. To control and monitor the device from / to the external logic world – usually operating in positive voltage area – a dedicated logic interface block (INHIBIT and OCM functions) has been implemented with +3 V to +5 V supplied line V(+). In case V(+) = 0 V, inhibit and OCM functions are not available: In this condition, INHIBIT function is ON and OCM pin is “no care”. The device is internally protected by several blocks.

5.1 ADJ pin

The load voltage feed back comes from an external divider resistor bridge middle point to ADJ pin established between load terminals.

5.2 Inhibit ON-OFF control

When INHIBIT pin is TTL-high (positive), the device switches off current and voltage output. The device is ON when INHIBIT pin is set TTL-low.

5.3 Overtemperature protection

A temperature detector internally monitors power element junction temperature. The device goes OFF circa 165 °-175 °C are reached, and returns ON when circa 100 °C. When internal temperature detector reaches 170 °C, the active power element can be at 225 °C: Device reliability cannot be granted during extensive operation duration with these conditions.

5.4 Overcurrent protection

I_{SC} pin. An internal non-fold back short-circuit limitation is set with I_{SHORT} > 4 A (V_O is 0 V). This value can be downward modified by an external resistor connected between I_{SC} and V_I pins, with a typical value range of 10 kΩ to 200 kΩ. To keep excellent V_O regulation, it is necessary to set I_{SHORT} 1.6 times greater than the maximum desired application I_O. When I_O reaches I_{SHORT} – 300 mA, the current limiter overrules regulation and V_O starts to drop and OCM flag is risen. When no current limitation adjustment is required, I_{SC} pin shall be left unbiased (as it is in 3 pin packages).

5.5 OCM pin

Goes low when current limiter starts to be active, otherwise V_{OCM} = V (+). It is buffered and can sink 10 mA. OCM pin is internally pulled-up by a 50 kΩ resistor. Can left open when V (+) = 0.

5.6 Alternates to

RHFL7913A is recommended to replace all industry negative regulators due to its exceptional radiation performances. To replace 3-terminal industry devices, use customized RHFL7913 fixed voltage versions.

6 Application information

Adjusting output voltage: R1 resistor must be connected between V_O and ADJ pins. R2 resistor must be connected between ADJ and GND pins. Resistor values can be derived from the following formula:

$$V_O = V_{ADJ} (1 + R1/R2) \text{ with } V_{ADJ} = -1.20 \text{ V}$$

To access all RHFL7913A adjustable functionality, V (+) shall be set at 3.0 V (max 5 V). As a consequence, V_I (-) cannot be greater than -9.0 V (resp. -7 V) due to -12 V maximum operation rating.

The device is functional as soon as $V_I - V_O$ voltage difference is slightly above power element saturation voltage. The adjustable pin to Ground resistor shall not be greater than 10 k Ω to make output feedback error be below 0.2%. A minimum 0.5 mA I_O is necessary to set to ensure perfect "no-load" regulation. It can be wise to dissipate this current into the divider bridge resistor.

All available V_I pins shall always be PCB interconnected, the same for all available V_O pins, otherwise device stability and reliability cannot be granted. The INHIBIT function switches off output current in an electronic way, is very quickly. According to Lenz' Law, external circuitry reacts with $-Ldi/dt$ terms which can be of high amplitude in case some series-inductance exists. Effect would be large transient voltage developed on both device terminals. External Schottky diodes set on V_I and V_O may prevent voltage excursions beyond max ratings. In the worst case, a 14 V Zener diode shall protect the device input. In case of capacitive load, a input-output protection diode can be necessary to prevent V_O to be greater than V_I during transient operation.

The device has been designed for high stability and low drop out operation: minimum 1 μ F input and output tantalum capacitors are therefore mandatory. Typical industry PCB design practices 10 μ F capacitors values are acceptable. Capacitor ESR range is from 0.020 Ω to over 20 Ω . Such range turns out to be useful when ESR increases at low temperature. When large transient currents are expected, larger value capacitors are necessary.

In case of high current operation with expected short-circuit events, caution shall be considered relatively to capacitors. They shall be connected as close as possible from device terminals. As some tantalum capacitors may permanently fail when submitted to high charge-up surge currents, it is recommended to decouple them with 470 nF polyester or ceramic capacitors.

RHFL7913A adjustable being manufactured with very high speed bipolar technology (6 GHz f_T transistors), the PCB layout shall be performed with unprecedented care, very low inductance, low mutually coupling lines, otherwise high frequency parasitic signals may be picked-up by the Device resulting into system self-oscillation. In difficult high current circumstances (coming from PCB layout) a 470 nF polyester capacitor connected between V_O and ADJ pin increases stability margins. Benefit is SVR performances extended to far higher frequencies.

6.1 Remote sensing operation

When load is physically far away from device output, the adjustable line can be set as a kelvin sense line by implementing the divider resistor bridge as close as possible from device, with a decoupling capacitor. The adjust pin kelvin sense line (to be not coupled with power line) picks-up load voltage (load also locally decoupled with a capacitor). This layout eliminates ohmic drop in load power wire. Similarly, by taking advantage of two separate ground terminals: power ground pin shall be directly connected to load ground terminal which is also the system ground, device signal ground shall be separately connected to load ground terminal by another kelvin line: In this way, ground ohmic errors are minimized because the only current flowing into device signal ground pin kelvin line is device I_q (a matter of a few mA).

7 Die information

RHFL7913A adjustable is also available in die form. Space dice are electrically tested by STMicroelectronics in such a way that, when mounted in proper thermal and electrical substrate, they are in full compliance with equivalent packaged device:

DIE physical dimensions.

DIE size: 110 mils x 166 mils

DIE thickness: 375 μm +/-25 μm (14.8 mils +/- 1 mil)

Pad size:

V_I , V_O pads: 245 μm x 544 μm

Control pads: 184 μm x 184 μm

Interface materials

Top Metallization: Al/Si/Cu 1.05 μm +/- 0.15 μm

Backside metallization: None

Glassivation

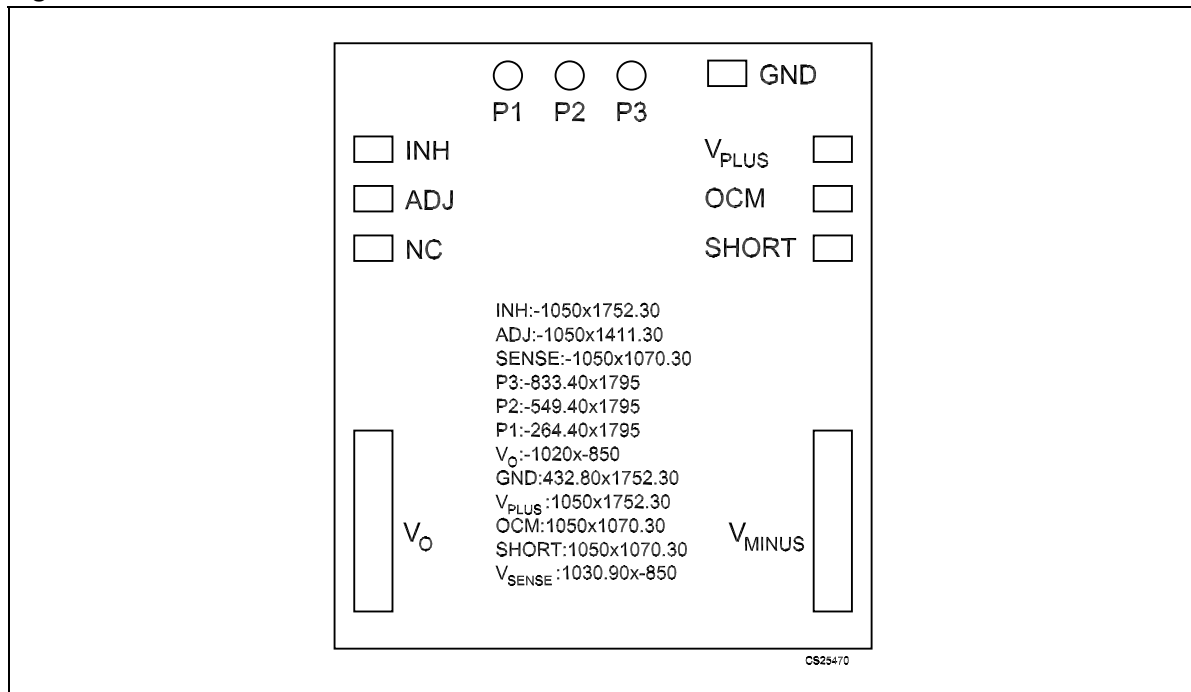

Type: P.Vapox + Nitride

Thickness: 0.6 μm +/- 0.1 μm + 0.6 μm +/-0.08 μm

Substrate: Silicon (connected to $V_I = V_{\text{minus}}$)

The SENSE pad is layout on the die but is not electrically connected to the IC and shall be left non-bonded during hybrid bonding.

Figure 3. DIE size

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
