μA727
Temperature-Controlled Differential Preamplifier

Special Function Products

Description

The μA727 is a monolithic, fixed gain, Differential Input/Output Preamplifier, constructed with the Fairchild Planar epitaxial process, mounted in a high thermal resistance package, and held at constant temperature by active regulator circuitry. The high gain and low-standby dissipation of the regulator circuit give tight temperature control over a wide ambient temperature range. The device is intended for use as a self-contained input stage in very low drift dc amplifiers, replacing complex chopper-stabilized amplifiers in such applications as thermo-couple bridges, strain-gauge transducers, and a/d converters.

- **VERY LOW OFFSET DRIFTS**
- **HIGH INPUT IMPEDANCE 300 MΩ**
- **WIDE COMMON MODE RANGE C_{MRR} = 100 dB**

Absolute Maximum Ratings

Operating Temperature Range	
Military (μA727)	−55°C to +125°C
Commercial (μA727C)	−20°C to +85°C
Storage Temperature Range	−65°C to +150°C
Pin Temperature (Soldering, 60 s)	300°C
Internal Power Dissipation	500 mW
Supply Voltage (Amplifier and Heater)	± 18 V
Differential Input Voltage	± 10 V
Common Mode Input Voltage	± 15 V
