# AK4344

## 100dB 96kHz 24-Bit Stereo 3.3V ΔΣ DAC

## GENERAL DESCRIPTION

The AK4344 is a 24bit low voltage & low power stereo. The AK4344 uses the Advanced Multi-Bit ΔΣ architecture, which achieves DR=100dB at 3.3V operation. The AK4344 integrates a combination of SCF and CTF filters increasing performance for systems with excessive clock jitter. The output voltage level can be set as high as 1Vrms. The AK4344 is offered in a space saving 16pin TSSOP package.

## FEATURES

- ☐ **Sampling Rate: 8kHz ~ 96kHz**
- ☐ **24-Bit 8 times FIR Digital Filter**
- ☐ **SCF with high tolerance to clock jitter**
- ☐ **Single-ended output buffer**
- ☐ **Digital de-emphasis for 32kHz, 44.1kHz, 48kHz sampling**
- ☐ **I/F Format: 24-Bit MSB justified, 16/24-Bit LSB justified, $I^2S$ Compatible**
- ☐ **Master Clock:**
  - **512/768/1024/1536fs for Half Speed (8kHz ~ 24kHz)**
  - **256/384/512/768fs for Normal Speed (8kHz ~ 48kHz)**
  - **128/192/256/384fs for Double Speed (48kHz ~ 96kHz)**
- ☐ **μP Interface: 4-wire/3-wire**
- ☐ **CMOS Input Level**
- ☐ **THD+N: -90dB(0dB)**
- ☐ **DR, S/N: 100dB**
- ☐ **DAC output voltage level: 1Vrms (@VDD=3.3V)**
- ☐ **Power Supply: 2.7 to 3.6V**
- ☐ **Ta = –20 ~ 85°C**
- ☐ **16pin TSSOP**

Note 11. BICK rising edge must not occur at the same time as LRCK edge.

Note 12. The AK4344 can be reset by bringing PDN pin = "L".

The PDN pulse width is proportional to the value of the capacitor (C) connected to VCOM pin. tPD = 4000× C.

When C = 4.7µF, tPD is 19ms(min).

The value of the capacitor (C) connected with VCOM pin should be 1µF ≤ C ≤ 10µF.

When the states of DIF1-0 pins change, the AK4344 should be reset by PDN pin.

## OPERATION OVERVIEW

### ■ System Clock

The external clocks, which are required to operate the AK4344, are MCLK, BICK and LRCK. The master clock (MCLK) should be synchronized with LRCK but the phase is not critical. The MCLK is used to operate the digital interpolation filter and the delta-sigma modulator. The MCLK frequency is detected from the relation between MCLK and LRCK automatically. The Half speed, the Normal speed and the Double speed mode are selected with the DFS1-0 bits (Table 1). The sampling speed mode is set depending on the MCLK frequency automatically for Auto mode (DFS1 bit = DFS0 bit = "1") (Table 2).

The AK4344 is automatically placed in the reset mode when MCLK stops in the normal operation mode (PDN pin = "H"), and the analog output becomes the VCOM voltage. After MCLK is input again, the AK4344 is powered up. After exiting reset by PDN pin at power-up etc., the AK4344 is in the reset mode until MCLK and LRCK are input.

### ■ Audio Interface Format

The Data is shifted in via the SDTI pin using BICK and LRCK inputs. The DIF1-0 bits as shown in Table 3 can select four serial data modes. In all modes the serial data is MSB-first, 2's compliment format and is latched on the rising edge of BICK. Mode 3 can be used for 16bit $I^2S$ Compatible format by zeroing the unused LSBs at BICK ≥ 48fs or BICK = 32fs.

| Mode | DIF1 | DIF0 | SDTI Format | BICK | Figure |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 16bit, LSB justified | ≥ 32fs | Figure 10 |

## ■ De-emphasis Filter

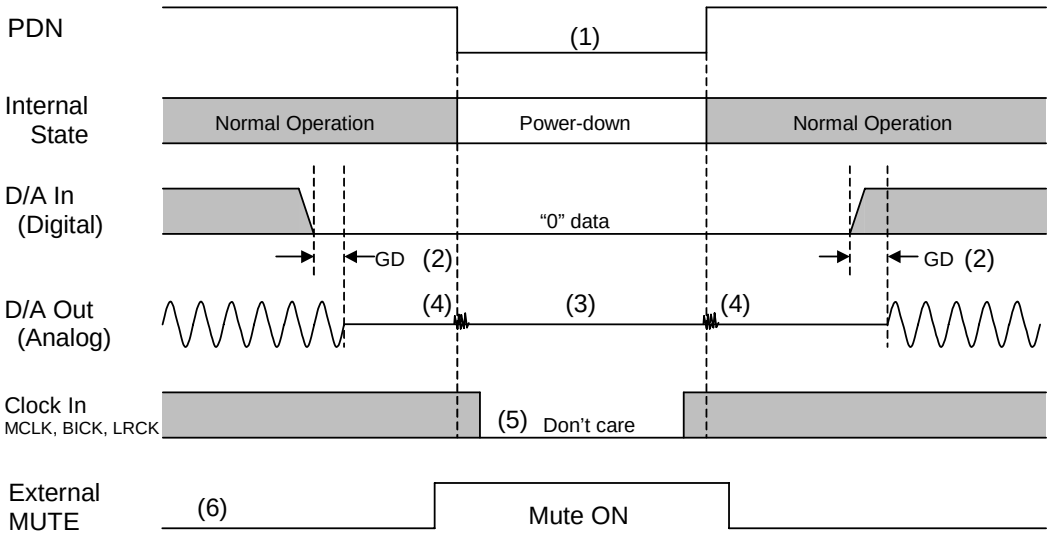
A digital de-emphasis filter is available for 32, 44.1 or 48kHz sampling rates (tc = 50/15μs) and is controlled by DEM0 and DEM1. In case of double speed and quad speed mode, the digital de-emphasis filter is always off.

| DEM1 | DEM0 | Mode | |
|---|---|---|---|
| 0 | 0 | 44.1kHz | |
| 0 | 1 | OFF | (default) |
| 1 | 0 | 48kHz | |
| 1 | 1 | 32kHz | |

Table 4. De-emphasis Filter Control (Normal Speed Mode)

## ■ Power-down

The AK4344 is placed in the power-down mode by bringing PDN pin = "L". and the digital filter is reset at the same time. This reset should always be done after power up.



Notes:

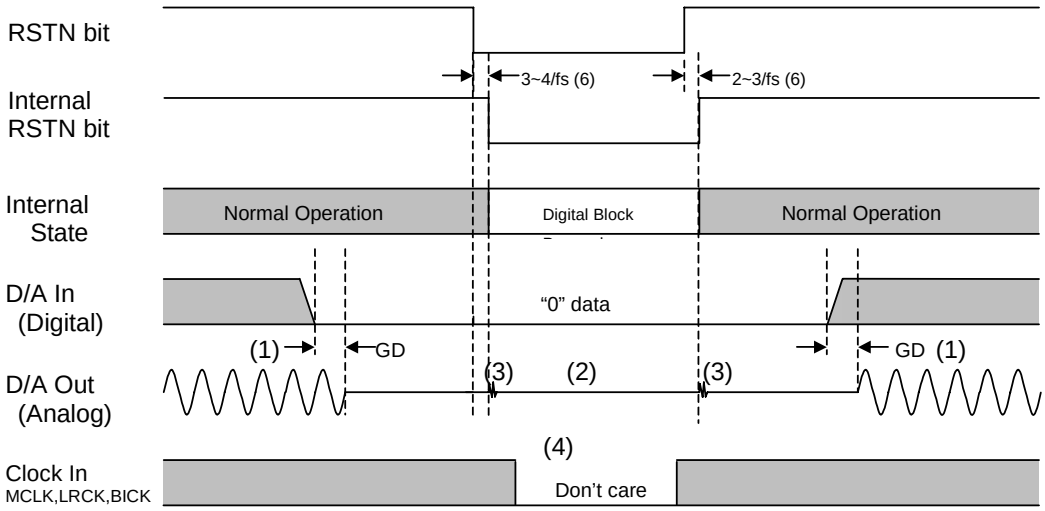
(1) PDN pin should be "L" for 19ms or more when an electrolytic capacitor 4.7μF is attached between VCOM pin and VSS.
(2) The analog output corresponding to digital input has the group delay (GD).
(3) When PDN pin = "L", the analog output is Hi-Z.
(4) Click noise occurs in 3 ~ 4LRCK at both edges (↑ ↓) of PDN signal. This noise is output even if "0" data is input.
(5) The external clocks (MCLK, BICK and LRCK) can be stopped in the power down mode (PDN pin = "L").
(6) Please mute the analog output externally if the click noise (4) influences system application. The timing example is shown in this figure.

Figure 14. Power-down/up sequence example

## ■ Reset Function

(1) Reset by RSTN bit

When RSTN bit =0, DAC is powered down but the internal register values are not initialized. The analog outputs go to VCOM voltage. Figure 15 shows the example of reset by RSTN bit.

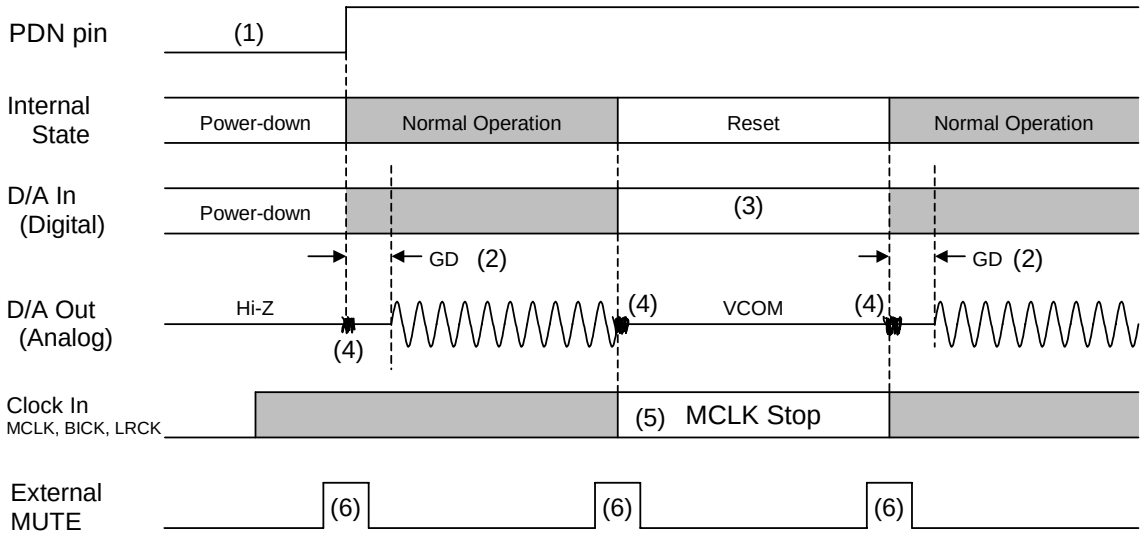


Notes:

(1) The analog output corresponding to digital input has the group delay (GD).
(2) Analog outputs go to VCOM voltage (VDD/2).
(3) Click noise occurs at the edges("↑ ↓") of the internal timing of RSTN bit. This noise is output even if "0" data is input.
(4) The external clocks (MCLK, BICK and LRCK) can be stopped in the reset mode (RSTN bit = "0").
(5) There is a delay, 3~4/fs from RSTN bit "0" to the internal RSTN bit "0", and 2~3/fs from RSTN bit "1" to the internal RSTN bit "1".

Figure 15. Reset Sequence Example1

(2) RESET by MCLK stop (PDN pin = "H")
When MCLK stops, DAC is powered down but the internal register values are not initialized. The analog outputs go to VCOM voltage.



Notes:

(1) PDN pin should be "L" for 19ms or more when an electrolytic capacitor 4.7μF is attached between VCOM pin and VSS.
(2) The analog output corresponding to digital input has the group delay (GD).
(3) The digital data can be stopped. The click noise after MCLK is input again by inputting the "0" data to this section can be reduced.
(4) Click noise occurs in 3 ~ 4LRCK at both edges (↑ ↓) of PDN signal, MCLK inputs and MCLK stops. This noise is output even if "0" data is input.
(5) The external clocks (BICK and LRCK) can be stopped in the power down mode (MCLK stop).
(6) Please mute the analog output externally if the click noise (4) influences system application. The timing example is shown in this figure.

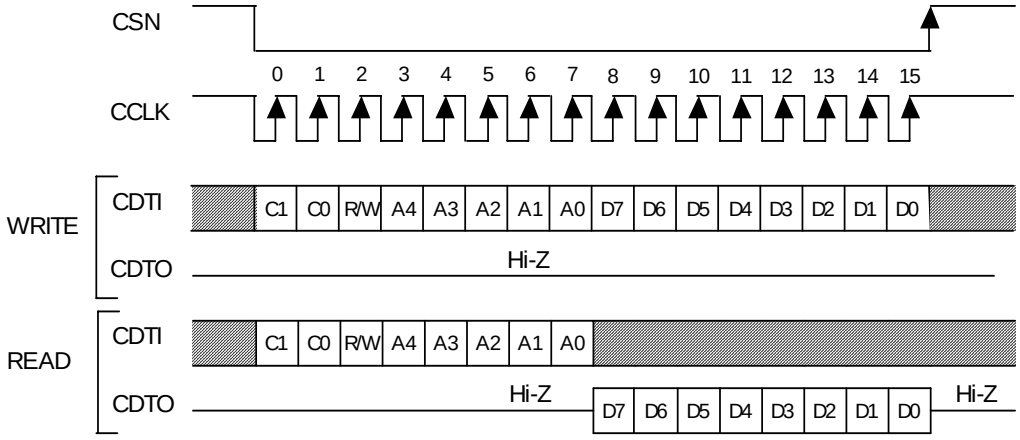
Figure 16. Reset Sequence Example 2

## ■ μP Control Interface

The AK4344 can select 4-wire μP I/F mode (MODE bit = "0") or 3-wire μP I/F mode (MODE bit = "1").

### 1.4-wire μP I/F mode (MODE bit = "0", default)

The internal registers may be either written or read by the 4-wire μP interface pins: CSN, CCLK, CDTI and CDTO. The data on this interface consists of Chip address (2bits, C1/0; fixed to "01"), Read/Write (1bit), Register address (MSB first, 5bits) and Control data (MSB first, 8bits). Address and data are clocked in on the rising edge of CCLK and data is clocked out on the falling edge. For write operations, data is latched after the 16th rising edge of CCLK, after a high-to-low transition of CSN. CSN should be set to "H" once after 16 CCLKs. For read operations, the CDTO output goes high impedance after a low-to-high transition of CSN. The maximum speed of CCLK is 5MHz. PDN pin = "L" resets the registers to their default values.



C1-C0: Chip Address: (Fixed to "01")
R/W: READ/WRITE (0:READ, 1:WRITE)
A4-A0: Register Address
D7-D0: Control Data

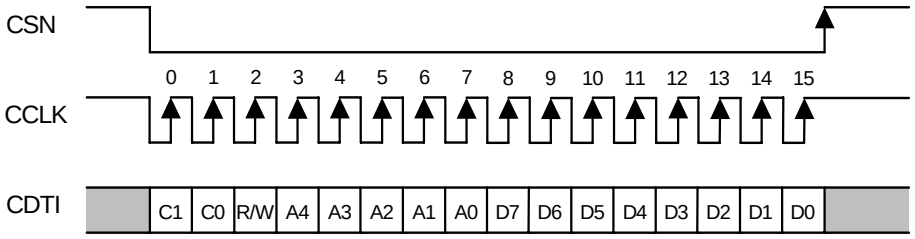
Figure 17. 4-wire Serial Control I/F Timing

*When the AK4344 is in the power down mode (PDN pin = "L") or the MCLK is not provided, writing into the control register is inhibited.

2.3-wire µP I/F mode (MODE bit = "1")

Internal registers may be written by 3-wire µP interface pins, CSN, CCLK and CDTI. The data on this interface consists of Chip Address (2bits, C1/0; fixed to "01"), Read/Write (1bit; fixed to "1", Write only), Register Address (MSB first, 5bits) and Control Data (MSB first, 8bits). AK4344 latches the data on the rising edge of CCLK, so data should clocked in on the falling edge. The writing of data becomes valid by 16th CCLK after a high to low transition of CSN. CSN should be set to "H" once after 16 CCLKs for each address. The clock speed of CCLK is 5MHz (max).

PDN pin = "L" resets the registers to their default values. The internal timing circuit is reset by RSTN bit, but the registers are not initialized.



C1-C0: Chip Address (Fixed to "01")
R/W: READ/WRITE (Fixed to "1", Write only)
A4-A0: Register Address
D7-D0: Control Data

Figure 18. Control I/F Timing

*The AK4344 does not support the read command and chip address. C1/0 and R/W are fixed to "011"
*When the AK4344 is in the power down mode (PDN pin = "L") or the MCLK is not provided, writing into the control register is inhibited.

## ■ DAC input select

The AK4344 can select 4-wire µP I/F mode (MODE bit = "0") or 3-wire µP I/F mode (MODE bit = "1"). In 3-wire µP I/F mode, the AK4344 can select the input data of DAC from SDTI1 or SDTI2 data.

| MODE | SEL | µP / IF | DAC input |
|---|---|---|---|
| 0 | x | 4-wire | SDTI1 |
| 1 | 0 | 3-wire | SDTI1 |
| 1 | 1 | 3-wire | SDTI2 |

Notes:

For addresses from 03H to 1FH, data must not be written.

When PDN pin goes "L", the registers are initialized to their default values.

When RSTN bit goes "0", the only internal timing is reset and the registers are not initialized to their default values. All data can be written to the register even if PW or RSTN bit is "0".

The bits shown as "0" should be written "0" and the bits shown as "1" should be written "1".

## SYSTEM DESIGN

Figure 19 and Figure 20 shows the system connection diagram. The evaluation board is available which demonstrates application circuits, the optimum layout, power supply arrangements and measurement results.

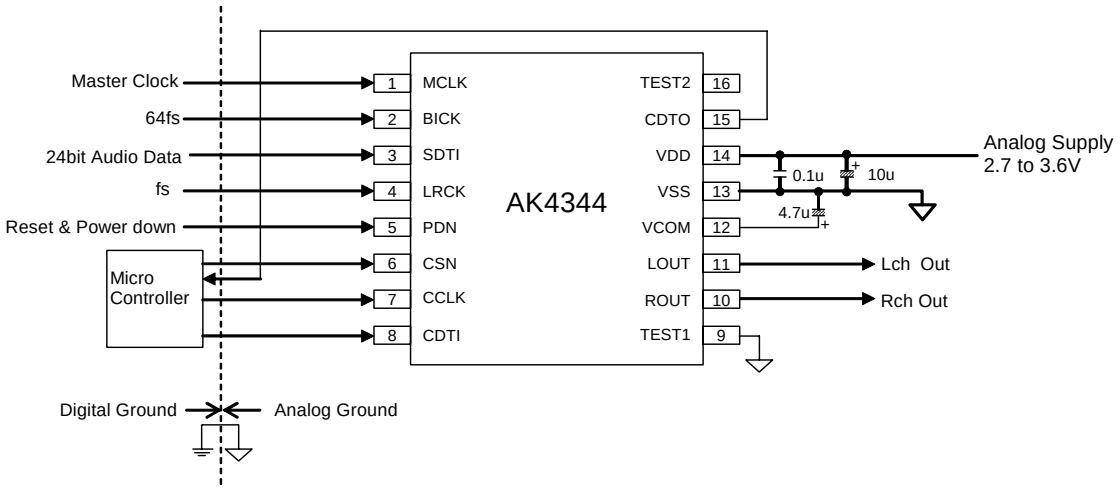

Figure 19. Typical Connection Diagram (Mode bit = "0", 4 wire mode )

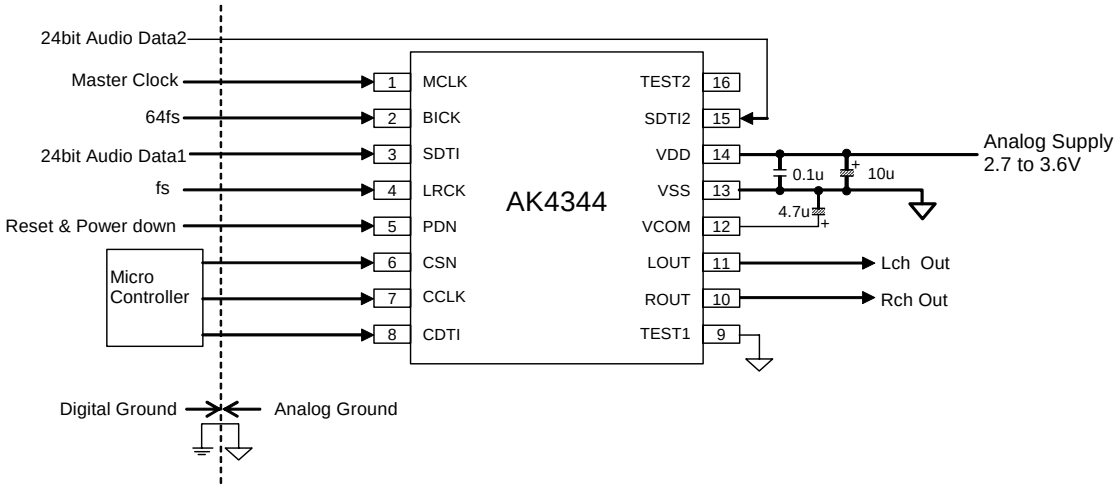

Figure 20. Typical Connection Diagram (Mode bit = "1", 3 wire mode )

### 1. Grounding and Power Supply Decoupling

The AK4344 requires careful attention for power supply and grounding arrangements. VDD is usually supplied from the analog supply in the system. System analog ground and digital ground should be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors should be as near to the AK4344 as possible, with the small value ceramic capacitor being the closest.

### 2. Voltage Reference

The differential Voltage between VDD and VSS sets the analog output range. VCOM is used as a common voltage of the analog signal. VCOM pin is a signal ground of this chip. An electrolytic capacitor about 4.7μF should be attached between VCOM pin and VSS. No load current may be drawn from VCOM pin. Especially, the ceramic capacitor should be connected to this pin as near as possible.

### 3. Analog Outputs

The analog outputs are single-ended and centered around the VCOM voltage (0.5 × VDD). The output signal range is typically 2.8Vpp (typ@VDD=3.3V). The internal switched-capacitor filter and continuous-time filter attenuate the noise generated by the delta-sigma modulator beyond the audio passband. The output voltage is a positive full scale for 7FFFFFH (@24bit) and a negative full scale for 800000H (@24bit). The ideal output is VCOM voltage (0.5 × VDD) for 000000H (@24bit).

DC offsets on analog outputs are eliminated by AC coupling since analog outputs have DC offsets of VCOM + a few mV. Figure 21 shows an example of the external LPF with 2.8Vpp (1Vrms) output.

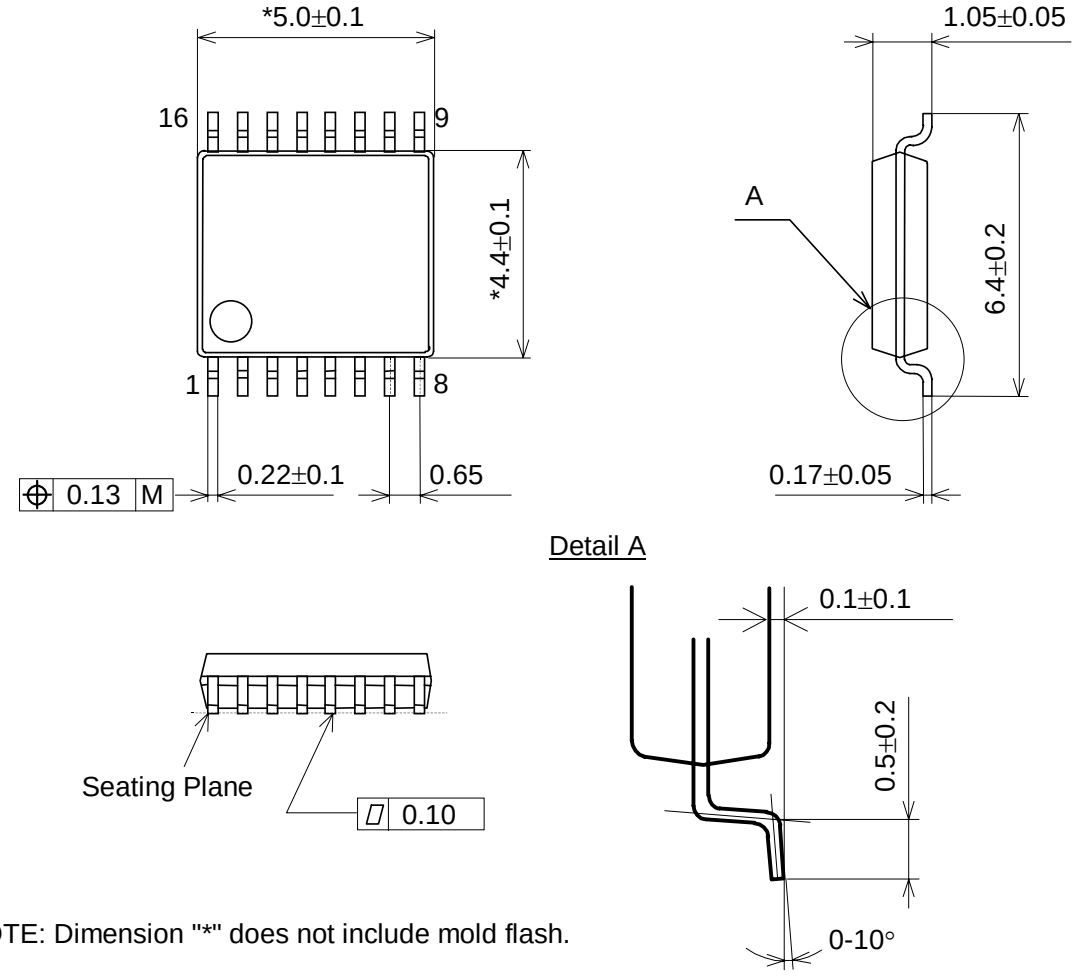
## PACKAGE

16pin TSSOP (Unit: mm)

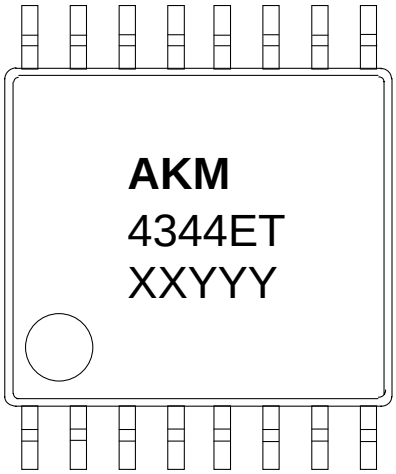


NOTE: Dimension "*" does not include mold flash.

### ■ Package & Lead frame material

| | |
|---|---|
| Package molding compound: | Epoxy |
| Lead frame material: | Cu |
| Lead frame surface treatment: | Solder (Pb free) plate |

## MARKING



1) Pin #1 indication
2) Date Code : XXYYY (5 digits)
   XX: Lot#
   YYY: Date Code
3) Marketing Code : 4344ET
4) Asahi Kasei Logo
