

Low Power Microprocessor Supervisory Circuits

- Precision Voltage Monitor:
 - SP705/707/813L at 4.65V
 - SP706/708/813M at 4.40V
- RESET Pulse Width - 200ms
- Independent Watchdog Timer - 1.6s Timeout (SP705/706/813L/813M)
- 60µA Maximum Supply Current
- Debounced TTL/CMOS Manual Reset Input
- $\overline{\text{RESET}}$ Asserted Down to $V_{\text{CC}} = 1\text{V}$
- Voltage Monitor for Power Failure or Low Battery Warning
- Available in 8-pin PDIP, NSOIC, and µSOIC packages
- Pin Compatible Enhancement to Industry Standard 705-708/813L Series
- Functionally Compatible to Industry Standard 1232 Series

DESCRIPTION...

The **SP705-708/813L/813M** series is a family of microprocessor (μP) supervisory circuits that integrate myriad components involved in discrete solutions which monitor power-supply and battery in μP and digital systems. The **SP705-708/813L/813M** series will significantly improve system reliability and operational efficiency when compared to solutions obtained with discrete components. The features of the **SP705-708/813L/813M** series include a watchdog timer, a μP reset, a Power Fail Comparator, and a manual-reset input. The **SP705-708/813L/813M** series is ideal for applications in automotive systems, computers, controllers, and intelligent instruments. The **SP705-708/813L/813M** series is an ideal solution for systems in which critical monitoring of the power supply to the μP and related digital components is demanded.

Part Number	RESET Threshold	RESET Active	Manual RESET	Watchdog	PFI Accuracy
SP705	4.65 V	LOW	YES	YES	4%
SP706	4.40 V	LOW	YES	YES	4%
SP707	4.65 V	LOW and HIGH	YES	NO	4%
SP708	4.40 V	LOW and HIGH	YES	NO	4%
SP813L	4.65 V	HIGH	YES	YES	4%
SP813M	4.40V	HIGH	YES	YES	4%

ABSOLUTE MAXIMUM RATINGS

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability and cause permanent damage to the device.

V_{CC} -0.3V to +6.0V
 All Other Inputs (Note 1) -0.3V to ($V_{CC}+0.3V$)

Input Current:

V_{CC} 20mA
 GND 20mA
 Output Current (all outputs) 20mA
 ESD Rating 4KV

Continuous Power Dissipation

Plastic DIP (derate 9.09mW/°C above +70°C) 727mW
 SO (derate 5.88mW/°C above +70°C) 471mW
 Mini SO (derate 4.10mW/°C above +70°C) 330mW

Storage Temperature Range -65°C to +160°C

Lead Temperature (soldering, 10s) +300°C

SPECIFICATIONS

$V_{CC} = 4.75V$ to $5.50V$ for SP705/707/813L, $V_{CC} = 4.50V$ to $5.50V$ for SP706/708/813M, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted, typical at 25°C.

PARAMETER	MIN.	TYP.	MAX.	UNITS	CONDITIONS

Note 1: The input voltage limits on PFI and \overline{MR} can be exceeded if the input current is less than 10mA.

Note 2: Applies to both RESET in the SP705-SP708 and RESET in the SP707/708/813L/813M.

Figure 1. Pinouts

NAME	FUNCTION	PIN DESCRIPTION					
		SP705/706		SP707/708		SP813L/813M	
		DIP/ SOIC	μSOIC	DIP/ SOIC	μSOIC	DIP/ SOIC	μSOIC
$\overline{\text{MR}}$	Manual Reset - This input triggers a reset pulse when pulled below 0.8V. This active-LOW input has an internal 250μA pull-up current. It can be driven from a TTL or CMOS logic line or shorted to ground with a switch	1	3	1	3	1	3
V_{CC}	+5V power supply	2	4	2	4	2	4
GND	Ground reference for all signals	3	5	3	5	3	5
PFI	Power-Fail Input - When this voltage monitor input is less than 1.25V, $\overline{\text{PFO}}$ goes LOW. Connect PFI to ground or V_{CC} when not in use.	4	6	4	6	4	6
$\overline{\text{PFO}}$	Power-Fail Output - This output is HIGH until PFI is less than 1.25V.	5	7	5	7	5	7
WDI	Watchdog Input - If this input remains HIGH or LOW for 1.6s, the internal watchdog timer times out and $\overline{\text{WDO}}$ goes LOW. Floating WDI or connecting WDI to a high-impedance tri-state buffer disables the watchdog feature. The internal watchdog timer clears whenever $\overline{\text{RESET}}$ is asserted, WDI is tri-stated, or whenever WDI sees a rising or falling edge.	6	8	-	-	6	8
N.C.	No Connect.	-	-	6	8	-	-
$\overline{\text{RESET}}$	Active-LOW $\overline{\text{RESET}}$ Output - This output pulses LOW for 200ms when triggered and stays LOW whenever V_{CC} is below the reset threshold (4.65V for the SP705/707/813L and 4.40V for the SP706/708). It remains LOW for 200ms after V_{CC} rises above the reset threshold or $\overline{\text{MR}}$ goes from LOW to HIGH. A watchdog timeout will not trigger $\overline{\text{RESET}}$ unless $\overline{\text{WDO}}$ is connected to $\overline{\text{MR}}$.	7	1	7	1	-	-
$\overline{\text{WDO}}$	Watchdog Output - This output pulls LOW when the internal watchdog timer finishes its 1.6s count and does not go HIGH again until the watchdog is cleared. $\overline{\text{WDO}}$ also goes LOW during low-line conditions. Whenever V_{CC} is below the reset threshold, $\overline{\text{WDO}}$ stays LOW. However, unlike $\overline{\text{RESET}}$, $\overline{\text{WDO}}$ does not have a minimum pulse width. As soon as V_{CC} is above the reset threshold, $\overline{\text{WDO}}$ goes HIGH with no delay.	8	2	-	-	8	2
RESET	Active-HIGH RESET Output - This output is the complement of $\overline{\text{RESET}}$. Whenever $\overline{\text{RESET}}$ is HIGH, RESET is LOW, and vice versa. Note the SP813L/813M has a reset output only.	-	-	8	2	7	1

FEATURES

The **SP705-708/813L/813M** series provides four key functions:

1. A reset output during power-up, power-down and brownout conditions.
2. An independent watchdog output that goes LOW if the watchdog input has not been toggled within 1.6 seconds.
3. A 1.25V threshold detector for power-fail warning, low battery detection, or monitoring a power supply other than +5V.
4. An active-LOW manual-reset that allows RESET to be triggered by a pushbutton switch.

The **SP707/708** devices are the same as the **SP705/706** devices except for the active-HIGH RESET substitution of the watchdog timer. The **SP813L** is the same as the **SP705** except an active-HIGH $\overline{\text{RESET}}$ is provided rather than an active-LOW $\overline{\text{RESET}}$. The **SP705/707/813L** devices generate a reset when the supply voltage drops below 4.65V. The **SP706/708/813M** devices generate a reset below 4.40V.

The **SP705-708/813L/813M** series is ideally suited for applications in automotive systems, intelligent instruments, and battery-powered computers and controllers. The **SP705-708/813L/813M** series is ideally applied in environments where monitoring of power supply to a μP and its related components is critical.

THEORY OF OPERATION

The **SP705-708/813L/813M** series is a microprocessor (μP) supervisory circuit that monitors the power supplied to digital circuits such as microprocessors, microcontrollers, or memory. The series is an ideal solution for portable, battery-powered equipment that requires power supply monitoring. Implementing this series will reduce the number of components and overall complexity. The watchdog functions of this product family will continuously oversee the operational status of a system. The operational features and benefits of the **SP705-708/813L/813M** series are described in more detail below.

RESET Output

A microprocessor's reset input starts the μP in a known state. The **SP705-708/813L/813M** series asserts reset during power-up and prevents code execution errors during power-down or brownout conditions.

On power-up, once V_{CC} reaches 1V, $\overline{\text{RESET}}$ is a guaranteed logic LOW of 0.4V or less. As V_{CC} rises, $\overline{\text{RESET}}$ stays LOW. When V_{CC} rises above the reset threshold, an internal timer releases $\overline{\text{RESET}}$ after 200ms. $\overline{\text{RESET}}$ pulses LOW whenever V_{CC} dips below the reset threshold, such as in a brownout condition. When a brownout condition occurs in the middle of a previously initiated reset pulse, the pulse continues for at least another 140ms. On power-down, once V_{CC} falls below the reset threshold, $\overline{\text{RESET}}$ stays LOW and is guaranteed to be 0.4V or less until V_{CC} drops below 1V.

The **SP707/708/813L/813M** active-HIGH $\overline{\text{RESET}}$ output is simply the complement of the $\overline{\text{RESET}}$ output and is guaranteed to be valid with V_{CC} down to 1.1V. Some μPs , such as Intel's 80C51, require an active-HIGH reset pulse.

Watchdog Timer

The **SP705/706/813L/813M** watchdog circuit monitors the μP 's activity. If the μP does not toggle the watchdog input (WDI) within 1.6 seconds and WDI is not tri-stated, $\overline{\text{WDO}}$ goes LOW. As long as $\overline{\text{RESET}}$ is asserted or the WDI input is tri-stated, the watchdog timer will stay cleared and will not count. As soon as $\overline{\text{RESET}}$ is released and WDI is driven HIGH or LOW, the timer will start counting. Pulses as short as 50ns can be detected.

Figure 14. SP705/706/813L/813M Watchdog Timing Waveforms

Typically, \overline{WDO} will be connected to the non-maskable interrupt input (NMI) of a μP . When V_{CC} drops below the reset threshold, \overline{WDO} will go LOW whether or not the watchdog timer has timed out. Normally this would trigger an NMI but \overline{RESET} goes LOW simultaneously, and thus overrides the NMI.

If WDI is left unconnected, \overline{WDO} can be used as a low-line output. Since floating WDI disables the internal timer, \overline{WDO} goes LOW only when V_{CC} falls below the reset threshold, thus functioning as a low-line output.

Figure 15. SP705/706 Timing Diagrams with WDI Tri-stated. The SP707/708/813L/813M RESET Output is the Inverse of the RESET Waveform Shown.

Power-Fail Comparator

The power-fail comparator can be used for various purposes because its output and noninverting input are not internally connected. The inverting input is internally connected to a 1.25V reference.

To build an early-warning circuit for power failure, connect the PFI pin to a voltage divider as shown in *Figure 16*. Choose the voltage divider ratio so that the voltage at PFI falls below 1.25V just before the +5V regulator drops out. Use $\overline{\text{PFO}}$ to interrupt the μP so it can prepare for an orderly power-down.

Manual Reset

The manual-reset input ($\overline{\text{MR}}$) allows RESET to be triggered by a pushbutton switch. The switch is effectively debounced by the 140ms minimum RESET pulse width. $\overline{\text{MR}}$ is TTL/CMOS logic compatible, so it can be driven by an external logic line. $\overline{\text{MR}}$ can be used to force a watchdog timeout to generate a RESET pulse in the **SP705/706/813L/813M**. Simply connect $\overline{\text{WDO}}$ to $\overline{\text{MR}}$.

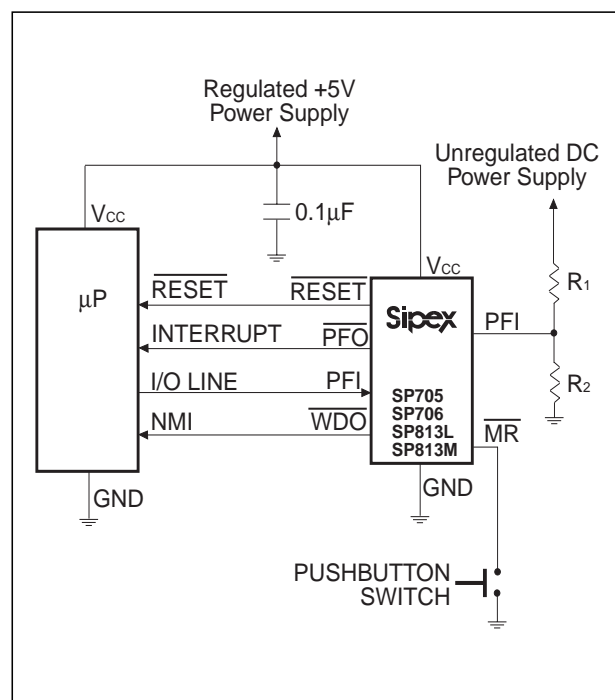

Figure 16. Typical Operating Circuit

Ensuring a Valid $\overline{\text{RESET}}$ Output Down to $V_{\text{CC}} = 0\text{V}$

When V_{CC} falls below 1V, the **SP705/706/707/708** $\overline{\text{RESET}}$ output no longer sinks current, it becomes an open circuit. High-impedance CMOS logic inputs can drift to undetermined voltages if left undriven. If a pull-down resistor is added to the $\overline{\text{RESET}}$ pin, any stray charge or leakage currents will be shunted to ground, holding $\overline{\text{RESET}}$ LOW. The resistor value is not critical. It should be about 100K Ω , large enough not to load $\overline{\text{RESET}}$ and small enough to pull $\overline{\text{RESET}}$ to ground.

Monitoring Voltages Other Than the Unregulated DC Input

Monitor voltages other than the unregulated DC by connecting a voltage divider to PFI and adjusting the ratio appropriately. If required, add hysteresis by connecting a resistor (with a value approximately 10 times the sum of the two resistors in the potential divider network) between PFI and $\overline{\text{PFO}}$. A capacitor between PFI and GND will reduce the power-fail circuit's

Figure 17. Monitoring Both +5V and +12V Power Supplies

sensitivity to high-frequency noise on the line being monitored. $\overline{\text{RESET}}$ can be used to monitor voltages other than the +5V V_{CC} line. Connect $\overline{\text{PFO}}$ to $\overline{\text{MR}}$ to initiate a $\overline{\text{RESET}}$ pulse when PFI drops below 1.25V. *Figure 17* shows the **SP705/706/707/708** configured to assert $\overline{\text{RESET}}$ when the +5V supply falls below the RESET threshold, or when the +12V supply falls below approximately 11V.

Monitoring a Negative Voltage Supply

The power-fail comparator can also monitor a negative supply rail, shown in *Figure 18*. When the negative rail is good (a negative voltage of large magnitude), $\overline{\text{PFO}}$ is LOW. By adding the resistors and transistor as shown, a HIGH $\overline{\text{PFO}}$ triggers $\overline{\text{RESET}}$. As long as $\overline{\text{PFO}}$ remains HIGH, the **SP705-708/813L/813M** will keep $\overline{\text{RESET}}$ asserted (where $\overline{\text{RESET}} = \text{LOW}$ and $\text{RESET} = \text{HIGH}$). Note that this circuit's accuracy depends on the PFI threshold tolerance, the V_{CC} line, and the resistors.

Figure 18. Monitoring a Negative Voltage Supply

Interfacing to μPs with Bidirectional $\overline{\text{RESET}}$ Pins

μPs with bidirectional $\overline{\text{RESET}}$ pins, such as the Motorola 68HC11 series, can contend with the **SP705/706/707/708** $\overline{\text{RESET}}$ output. If, for example, the $\overline{\text{RESET}}$ output is driven HIGH and the μP wants to pull it LOW, indeterminate logic levels may result. To correct this, connect a 4.7K Ω resistor between the $\overline{\text{RESET}}$ output and the μP reset I/O, as shown in *Figure 19*. Buffer the $\overline{\text{RESET}}$ output to other system components.

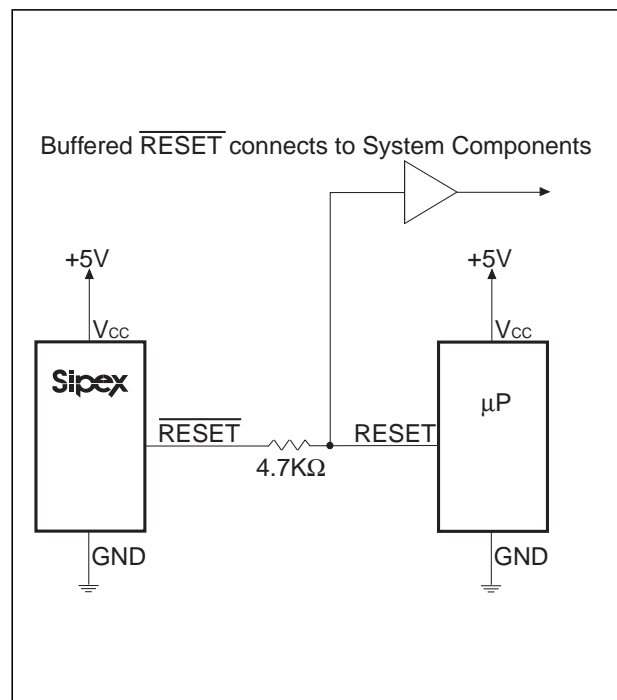

Figure 19. Interfacing to Microprocessors with Bidirectional $\overline{\text{RESET}}$ I/O for the SP705/706/707/708

Figure 20. Supply Current vs. Temperature

Figure 21. Supply Current vs. Supply Voltage

Applications

The **SP705-708/813L/813M** series offers unmatched performance and the lowest power consumption for these industry standard devices. Refer to *Figures 20* and *21* for supply current performance characteristics rated against temperature and supply voltages.

Table 2 shows how the **SP705-708/813L/813M** series can be used instead of the Dallas Semiconductor DS1232LP/LPS. *Table 2* illustrates to a designer the advantages and trade-offs of the **SP705-708/813L/813M** series compared to the Dallas Semiconductor device. While the names of the pin descriptions may differ, the functions are the same or very similar.

Unlike the DS1232, the **SP705-708/813L/813M** series has a separate watchdog output pin WDO which can be simply connected to the MR input to generate a Reset signal. The DS1232 has pin selectable features, while the **SP705-708/813L/813M** series has more fixed functions of reset threshold and watchdog time-out delay. For most applications, the fixed functions will be preferred, with the benefit of reduced cost due to a less complex part. In addition, the **SP705-708/813L/813M** series has a power fail input and output function not available with the DS1232 that is useful for monitoring systems with unregulated supply voltages. The **SP705-708/813L/813M** series is available in one of the industry's smallest space-saving package sizes, the μ SOIC.
