

General Description

The AAT351x PowerManager products are members of AnalogicTech's Total Power Management IC™ (TPMIC™) product family. This family of microprocessor reset circuits provides the ultimate in versatility, allowing system designers full customization of the μ P monitor and reset function without any additional components. The AAT351x family offers several combinations of threshold voltage, watchdog timeout period, reset active period, and output drive configurations, which are all factory-programmed options. All devices are available in 32 reset threshold voltages from 2.6V up to 5V, with three watchdog timeout periods from 6.3ms to 1600ms and three reset timeouts from 1ms up to 140ms. Available output configurations are active low push-pull, active low open drain, active low bi-directional, and active high push-pull.

The AAT351x family is designed to ignore fast negative transients on V_{DD} and to ensure that reset outputs remain valid down to 1V.

The AAT351x family is available in the Pb-free, space-saving 5-pin SOT23 surface mount package and is specified over the -40 to +85°C temperature range.

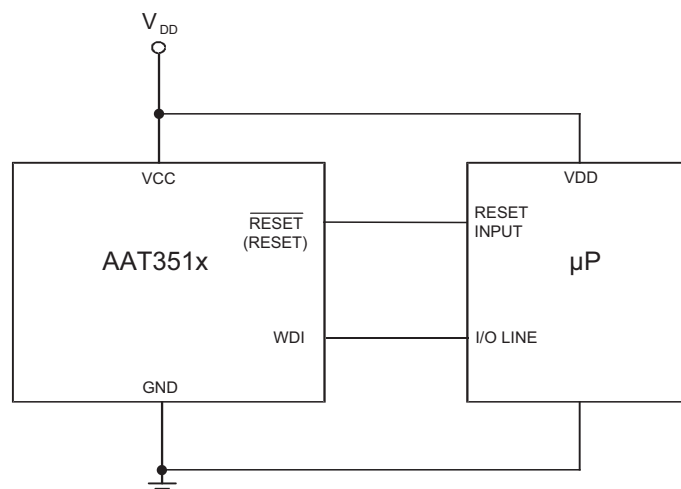

Features

- Tight Voltage Tolerance: $\pm 1.5\%$
- Low Quiescent Current: 5 μ A
- Guaranteed Reset Valid Down to 1V
- 32 Voltage Options from 2.6V to 5.0V
- Three Reset Active Period Options:
 - 1ms, 20ms, 140ms
- Three Watchdog Timeout Period Options:
 - 6.3ms, 102ms, 1600ms
- Four Output Options:
 - Open Drain
 - Inverting
 - Non-Inverting
 - Bi-Directional
- Low Temperature Coefficient: 100ppm/°C
- 5-Pin SOT23 Package

Applications

- Critical μ P and μ C Supply Monitoring
- Embedded Control Systems
- Industrial Controllers
- Intelligent Instruments
- Notebook Computers
- Portable Electronics
- Power-On Reset Circuits

1	N/A	1	1	$\overline{\text{RESET}}$	AAT3510/13/15: $\overline{\text{RESET}}$ output goes low whenever V_{DD} falls below the reset threshold. CMOS push-pull output. AAT3511/14/16: $\overline{\text{RESET}}$ output goes low whenever V_{DD} falls below the reset threshold. Bidirectional CMOS push-pull output intended to interface directly to microprocessors with bi-directional resets. AAT3517/18/19: $\overline{\text{RESET}}$ output goes low whenever V_{DD} falls below the reset threshold. Open drain output. Connect a pull-up resistor to any supply voltage up to 5.5V.
2	2	2	2	GND	Ground connection pin.
N/A	1	3	3	RESET	RESET active-high output. This CMOS push-pull signal is the logical inverse of $\overline{\text{RESET}}$.
3	3	N/A	4	$\overline{\text{MR}}$	Manual reset input pin. Active low. Pull low to force a reset.
4	4	4	N/A	WDI	Watchdog input pin. Triggers a reset if it remains in a steady state for the duration of the watchdog timer period.
5	5	5	5	VCC	Input voltage pin.

- Over-temperature limits are guaranteed by design, not production tested.
- Watchdog timeout period C is not available on AAT3513, AAT3514, and AAT3518.
- WDI is internally serviced within the watchdog period if WDI is left unconnected.
- The WDI input current is specified as the average input current when the WDI input is driven high or low. The WDI input is designed for a three-stated-output device with a $10\mu A$ maximum leakage current and capable of driving a maximum capacitive load of $200pF$. The three-state device must be able to source and sink at least $200\mu A$ when active.
