

Rail-to-Rail Operational Amplifier

General Description

The RT9133A/B consist low cost, high slew rates, single-supply rail-to-rail input and output operation amplifiers. The RT9133A contains a single amplifier and RT9133B contains two amplifiers. The RT9133A/B have high slew rates (12V/us), 35mA continuous output current, 120mA peak output current and offset voltage below 10mV. The RT9133A/B are ideal for Thin Film Transistor Liquid Crystal Displays (TFT-LCD).

The RT9133A is available in SOT-23-5 and WDFN-6L 2x2 packages. The RT9133B is available in MSOP-8 package. The RT9133A/B are specified for operation over the full -40°C to +85°C temperature range.

Ordering Information

RT9133A/B □ □

- Package Type
 - QW : WDFN-6L 2x2 (Single only)
 - B : SOT-23-5 (Single only)
 - F : MSOP-8 (Dual only)
- Operating Temperature Range
 - P : Pb Free with Commercial Standard
 - G : Green (Halogen Free with Commercial Standard)
- A : Single Amplifier
- B : Dual Amplifier

Note :

Richtek Pb-free and Green products are :

- RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- Suitable for use in SnPb or Pb-free soldering processes.
- 100% matte tin (Sn) plating.

Marking Information

For marking information, contact our sales representative directly or through a Richtek distributor located in your area, otherwise visit our website for detail.

Features

- Rail-to-Rail Output Swing
- Supply Voltage : 4.5V to 15V
- Continuous Output Current : 35mA
- Peak Output Current : 120mA
- High Slew Rate : 12V/ μ s
- Offset Voltage : 10mV
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- TFT-LCD Gamma / V_{COM} Buffer
- Portable Electronic Product
- Communications Product

Function Block Diagram

RT9133A

RT9133B

Functional Pin Description

Single

Pin No.		Pin Name	Pin Function
SOT-23-5	WDFN-6L 2x2		
1	4	VOUT	Amplifier Output.
--	2, Exposed Pad (7)	NC	No Internal Connection.
2	1	VS-	Negative Power Supply.
3	6	VIN+	Amplifier Non-Inverting Input.
4	5	VIN-	Amplifier Inverting Input.
5	3	VS+	Positive Power Supply.

Dual

Pin No.	Pin Name	Pin Function
1	VOUTA	Amplifier A Output.
2	VINA-	Amplifier A Inverting Input.
3	VINA+	Amplifier A Non-Inverting Input.
4	VS-	Negative Power Supply.
5	VINB+	Amplifier B Non-Inverting Input.
6	VINB-	Amplifier B Inverting Input.
7	VOUTB	Amplifier B Output.
8	VS+	Positive Power Supply.

Absolute Maximum Ratings (Note 1)

• Supply Voltage -----	17V
• Power Dissipation, P_D @ $T_A = 25^\circ C$	
SOT-23-5 -----	500mW
WDFN-6L 2x2 -----	758mW
MSOP-8 -----	781mW
• Package Thermal Resistance (Note 4)	
SOT-23-5, θ_{JA} -----	250°C/W
WDFN-6L 2x2, θ_{JA} -----	165°C/W
MSOP-8, θ_{JA} -----	160°C/W
• Differential Input Voltage -----	V_S
• Lead Temperature (Soldering, 10 sec.) -----	260°C
• Storage Temperature Range -----	-65°C to +150°C
• ESD Susceptibility (Note 2)	
HBM (Human Body Mode) -----	2kV
MM (Machine Mode) -----	200V

Recommended Operating Conditions (Note 3)

• Input Voltage -----	-0.5V to $V_S+0.5V$
• Junction Temperature Range -----	-65°C to +150°C
• Ambient Temperature Range -----	-40°C to +85°C

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. Devices are ESD sensitive. Handling precaution recommended.

Note 3. The device is not guaranteed to function outside its operating conditions.

Note 4. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective thermal conductivity test board (single layer, 1S) of JEDEC 51-3 thermal measurement standard.

Electrical Characteristics(V_{S+}=+5V, V_{S-}=-5V, R_L=10kΩ and C_L=10pF to 0V, T_A=25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Input Characteristics						
Input Offset Voltage	V _{OS}	V _{CM} = 0	--	2	15	mV
Average Offset Voltage Drift	ΔV _{OS} /ΔT	-40°C ≤ T _A ≤ 85°C	--	5	--	uV/°C

Typical Operating Characteristics

Applications Information

The RT9133A/B has high performance to drive large load for different application. High slew rates, rail-to-rail input and output capability and low power consumption are the features to make the RT9133A/B ideal for LCD applications. The RT9133A/B also has wide bandwidth and phase margin to drive a load of $10k\Omega$ and $10pF$.

Operating Voltage

The RT9133A/B is specified with single supply voltage from 5V to 15V. According to the electrical characteristics, the total supply voltage range is guaranteed from 4.5V to 15V. To refer the typical operational curves can get stable specifications in wide range of temperature and operating voltage.

The output swing of the RT9133A/B typically extends to within 80mV of positive/negative supply rails with 5mA load current source/sink. Decreasing the load current will get output swing even closer to the supply rails. Figure 1 shows the rail-to-rail input and output waveforms in the unit gain configuration without load current. The supply rails are $\pm 5V$. Applying an input $10V_{p-p}$ sinusoidal waveform results in a $9.8V_{p-p}$ output voltage as shown in Figure 1.

Figure 1. Operation with Rail-to-Rail Input and Output

Power Dissipation

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between

junction to ambient. The maximum power dissipation can be calculated by following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

Where

$T_{J(MAX)}$: The maximum operation junction temperature $150^{\circ}C$

T_A : The ambient temperature.

θ_{JA} : The junction to ambient thermal resistance.

The recommended operating condition of RT9133A/B is below the maximum junction temperature $150^{\circ}C$ of the die. The junction to ambient thermal resistance for SOT-23-5 package is $250^{\circ}C/W$, WDFN-6L 2x2 package is $165^{\circ}C/W$ and MSOP-8 package is $160^{\circ}C/W$ on the standard JEDEC 51-3 single layer thermal test board. The maximum power dissipation at $T_A = 25^{\circ}C$ can be calculated by following formula:

$$P_{D(MAX)} = (150^{\circ}C - 25^{\circ}C) / 250 = 500mW \text{ (SOT-23-5)}$$

$$P_{D(MAX)} = (150^{\circ}C - 25^{\circ}C) / 165 = 758mW \text{ (WDFN-6L 2x2)}$$

$$P_{D(MAX)} = (150^{\circ}C - 25^{\circ}C) / 160 = 781mW \text{ (MSOP-8)}$$

For continuous operation, do not exceed absolute maximum operation junction temperature $150^{\circ}C$. The power dissipation definition for the RT9133A/B is as following:

$$P_D = (V_s - V_{out}) \times I_{Load}$$

V_s : the supply voltage

V_{out} : the output voltage

I_{Load} : the output load current

The maximum power dissipation depends on operating ambient temperature for fixed $T_{J(MAX)}$ and thermal resistance θ_{JA} . Figure 2 shows the power dissipation derating curves of the RT9133A/B with different packages. As the ambient temperature increases, the maximum power dissipation decreases linearly to keep the junction temperature below $150^{\circ}C$.

Figure 2. Derating Curves for the RT9133A/B Package

Figure 3. V-com Test Circuit

Short Circuit Condition

An internal short-circuit protection circuit is implemented to protect the device from output short circuit. The RT9133A/B limits the short circuit current to $\pm 120\text{mA}$ if the output is directly shorted to positive/negative supply rails. For maximum reliability, the maximum continuous output current more than $\pm 35\text{mA}$ is not recommended.

Unused Amplifier

It is recommended to connect the unused amplifier as a unit gain circuit. The negative input is directly connected to the output and the positive input should be connected to the ground.

LCD Panel Applications

The RT9133A/B is mainly designed for LCD gamma and V-com buffer. OP Amplifier has 120mA instantaneous source/sink peak current. To test the performance of the RT9133A/B for LCD driving capability, the test circuit is to simulate the V-com driver as shown Figure 3. Series capacitors and resistors connected to the output of the OP simulate the load of LCD panel. The 300Ω and $3\text{k}\Omega$ feedback resistors are used to improve the settling time. This circuit is the worst case for a V-com buffer. Figure 4 shows the waveforms of the output peak current capability.
