

FEATURES

Low power operation

5 V operation

1.7 mA per channel max @ 0 Mbps to 2 Mbps

4.0 mA per channel max @ 2 Mbps to 10 Mbps

3 V operation

1.0 mA per channel max @ 0 Mbps to 2 Mbps

2.1 mA per channel max @ 2 Mbps to 10 Mbps

Bidirectional communication

3 V/5 V level translation

Schmitt trigger inputs

High temperature operation: 105°C

Up to 10 Mbps data rate (NRZ)

Programmable default output state

High common-mode transient immunity: >25 kV/μs

16-lead Pb-free SOIC wide body package

8.1 mm external creepage

Safety and regulatory approvals

UL recognition: 2500 V rms for 1 minute per UL 1577

CSA Component Acceptance Notice #5A

VDE certificate of conformity

DIN EN 60747-5-2 (VDE 0884 Part 2): 2003-01

DIN EN 60950 (VDE 0805): 2001-12; EN 60950: 2000

$V_{IORM} = 560$ V peak working voltage

APPLICATIONS

General-purpose multichannel isolation

SPI® interface/data converter isolation

RS-232/RS-422/RS-485 transceiver

Industrial field bus isolation

GENERAL DESCRIPTION

The ADuM131x¹ are 3-channel digital isolators based on Analog Devices, Inc. *iCoupler*® technology. Combining high speed CMOS and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives such as optocoupler devices.

By avoiding the use of LEDs and photodiodes, *iCoupler* devices remove the design difficulties commonly associated with optocouplers. The typical optocoupler concerns regarding uncertain current transfer ratios, maximum operating temperature, and lifetime effects are eliminated with the simple *iCoupler* digital interfaces and stable performance characteristics. The need for external drivers and other discrete components is eliminated with these *iCoupler* products. Furthermore, *iCoupler* devices consume one-tenth to one-sixth the power of optocouplers at comparable signal data rates. The *iCoupler* also offers higher

FUNCTIONAL BLOCK DIAGRAMS

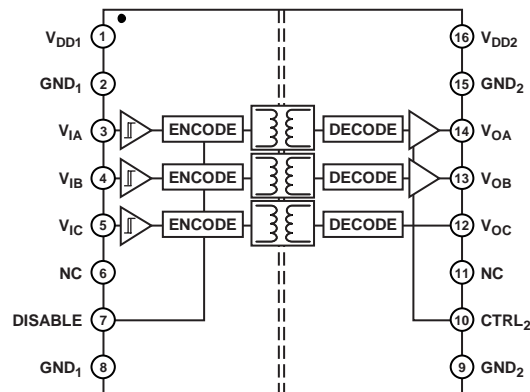

Figure 1. ADuM1310

Figure 2. ADuM1311

channel densities and more options for channel directionality.

The ADuM131x isolators provide three independent isolation channels in a variety of channel configurations and data rates up to 10 Mbps (see the Ordering Guide). All models operate with the supply voltage on either side ranging from 2.7 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. All products allow the user to predetermine the default output state in the absence of input V_{DD1} power with a simple control pin. Unlike other optocoupler alternatives, the ADuM131x isolators have a patented refresh feature that ensures dc correctness in the absence of input logic transitions and during power-up/power-down conditions.

¹ Protected by U.S. Patents 5,952,849; 6,873,065; and 7,075,329. Other patents pending.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION¹

4.5 V ≤ V_{DD1} ≤ 5.5 V, 4.5 V ≤ V_{DD2} ≤ 5.5 V; all min/max specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 5 V.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
DC SPECIFICATIONS						
ADuM1310, Total Supply Current, Three Channels ²						
DC to 2 Mbps						
V _{DD1} Supply Current	I _{DD1} (Q)		2.4	3.2	mA	DC to 1 MHz logic signal frequency
V _{DD2} Supply Current	I _{DD2} (Q)		1.2	1.6	mA	DC to 1 MHz logic signal frequency
10 Mbps (BRW Grade Only)						
V _{DD1} Supply Current	I _{DD1} (10)		6.6	9.0	mA	5 MHz logic signal frequency
V _{DD2} Supply Current	I _{DD2} (10)		2.1	3.0	mA	5 MHz logic signal frequency
ADuM1311, Total Supply Current, Three Channels ²						
DC to 2 Mbps						
V _{DD1} Supply Current	I _{DD1} (Q)		2.2	2.8	mA	DC to 1 MHz logic signal frequency
V _{DD2} Supply Current	I _{DD2} (Q)		1.8	2.4	mA	DC to 1 MHz logic signal frequency
10 Mbps (BRW Grade Only)						
V _{DD1} Supply Current	I _{DD1} (10)		4.5	5.7	mA	5 MHz logic signal frequency
V _{DD2} Supply Current	I _{DD2} (10)		3.5	4.3	mA	5 MHz logic signal frequency
For All Models

ADuM1310/ADuM1311

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
For All Models						
Output Rise/Fall Time (10% to 90%)	t_R/t_F		2.5		ns	$C_L = 15 \text{ pF}$, CMOS signal levels
Common-Mode Transient Immunity at Logic High Output ⁸	$ CM_H $	25	35		kV/ μs	$V_{IX} = V_{DD1}/V_{DD2}$, $V_{CM} = 1000 \text{ V}$, transient magnitude = 800 V
Common-Mode Transient Immunity at Logic Low Output	$ CM_L $	25	35		kV/ μs	$V_{IX} = 0 \text{ V}$, $V_{CM} = 1000 \text{ V}$, transient magnitude = 800 V
Refresh Rate	f_R		1.2		Mbps	
Input Enable Time ⁹	t_{ENABLE}			2.0	μs	$V_{IA}, V_{IB}, V_{IC} = 0 \text{ V or } V_{DD1}$
Input Disable Time ⁹	$t_{DISABLE}$			5.0	μs	$V_{IA}, V_{IB}, V_{IC} = 0 \text{ V or } V_{DD1}$
Input Supply Current per Channel, Quiescent ¹⁰	$I_{DDI(Q)}$		0.50	0.73	mA	
Output Supply Current per Channel, Quiescent ¹⁰	$I_{DDO(Q)}$		0.38	0.53	mA	
Input Dynamic Supply Current per Channel ¹¹	$I_{DDI(D)}$		0.12		mA/ Mbps	
Output Dynamic Supply Current per Channel ¹¹	$I_{DDO(D)}$		0.04		mA/ Mbps	

¹ All voltages are relative to their respective ground.

² The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total V_{DD1} and V_{DD2} supply currents as a function of data rate for ADuM1310/ADuM1311 channel configurations.

³ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.

⁴ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.

⁵ t_{PHL} propagation delay is measured from the 50% level of the falling edge of the V_{IX} signal to the 50% level of the falling edge of the V_{OX} signal. t_{PLH} propagation delay is measured from the 50% level of the rising edge of the V_{IX} signal to the 50% level of the rising edge of the V_{OX} signal.

⁶ t_{PSK} is the magnitude of the worst-case difference in t_{PHL} or t_{PLH} that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.

⁷ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.

⁸ CM_H is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8 V_{DD2}$. CM_L is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O < 0.8 \text{ V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.

⁹ Input enable time is the duration from when $V_{DISABLE}$ is set low until the output states are guaranteed to match the input states in the absence of any input data logic transitions. If an input data logic transition within a given channel does occur within this time interval, the output of that channel reaches the correct state within the much shorter duration, as determined by the propagation delay specifications within this data sheet. Input disable time is the duration from when $V_{DISABLE}$ is set high until the output states are guaranteed to reach their programmed output levels, as determined by the CTRL₂ logic state (see Table 12).

¹⁰ $I_{DDX(Q)}$ is the quiescent current drawn from the corresponding supply by a single channel. To calculate the total quiescent current, an additional inaccessible channel in the same orientation as Channel A must be included to account for the total current consumed.

¹¹ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

ELECTRICAL CHARACTERISTICS—3 V OPERATION¹

2.7 V \leq V_{DD1} \leq 3.6 V, 2.7 V \leq V_{DD2} \leq 3.6 V; all min/max specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at T_A = 25°C, V_{DD1} = V_{DD2} = 3.0 V.

Table 2.

¹ All voltages are relative to their respective ground.

² The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total V_{DD1} and V_{DD2} supply currents as a function of data rate for ADuM1310/ADuM1311 channel configurations.

³ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.

⁴ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.

⁵ t_{PHL} propagation delay is measured from the 50% level of the falling edge of the V_{IK} signal to the 50% level of the falling edge of the V_{OK} signal. t_{PLH} propagation delay is measured from the 50% level of the rising edge of the V_{IK} signal to the 50% level of the rising edge of the V_{OK} signal.

⁶ t_{PSK} is the magnitude of the worst-case difference in t_{PHL} or t_{PLH} that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.

⁷ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.

⁸ CM_H is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8 V_{DD2}$. CM_L is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O < 0.8 \text{ V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.

⁹ Input enable time is the duration from when $V_{DISABLE}$ is set low until the output states are guaranteed to match the input states in the absence of any input data logic transitions. If an input data logic transition within a given channel does occur within this time interval, the output of that channel reaches the correct state within the much shorter duration, as determined by the propagation delay specifications within this data sheet. Input disable time is the duration from when $V_{DISABLE}$ is set high until the output states are guaranteed to reach their programmed output levels, as determined by the CTRL₂ logic state (See Table 12).

¹⁰ $I_{DDX (Q)}$ is the quiescent current drawn from the corresponding supply by a single channel. To calculate the total quiescent current, an additional inaccessible channel in the same orientation as Channel A must be included to account for the total current consumed.

¹¹ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

ELECTRICAL CHARACTERISTICS—MIXED 5 V/3 V OR 3 V/5 V OPERATION¹

5 V/3 V operation: $4.5\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$, $2.7\text{ V} \leq V_{DD2} \leq 3.6\text{ V}$; 3 V/5 V operation: $2.7\text{ V} \leq V_{DD1} \leq 3.6\text{ V}$, $4.5\text{ V} \leq V_{DD2} \leq 5.5\text{ V}$; all min/max specifications apply over the entire recommended operation range, unless otherwise noted; all typical specifications are at $T_A = 25^\circ\text{C}$; $V_{DD1} = 3.0\text{ V}$, $V_{DD2} = 5\text{ V}$ or $V_{DD1} = 5\text{ V}$, $V_{DD2} = 3.0\text{ V}$.

$V_{DDx} = 3\text{ V Operation}$			0.02		mA/ Mbps	

¹ All voltages are relative to their respective ground.

² The supply current values for all four channels are combined when running at identical data rates. Output supply current values are specified with no output load present. The supply current associated with an individual channel operating at a given data rate can be calculated as described in the Power Consumption section. See Figure 6 through Figure 8 for information on per-channel supply current as a function of data rate for unloaded and loaded conditions. See Figure 9 through Figure 12 for total V_{DD1} and V_{DD2} supply currents as a function of data rate for ADuM1310/ADuM1311 channel configurations.

³ The minimum pulse width is the shortest pulse width at which the specified pulse width distortion is guaranteed.

⁴ The maximum data rate is the fastest data rate at which the specified pulse width distortion is guaranteed.

⁵ t_{PHL} propagation delay is measured from the 50% level of the falling edge of the V_{ix} signal to the 50% level of the falling edge of the V_{ox} signal. t_{PLH} propagation delay is measured from the 50% level of the rising edge of the V_{ix} signal to the 50% level of the rising edge of the V_{ox} signal.

⁶ t_{PSK} is the magnitude of the worst-case difference in t_{PHL} or t_{PLH} that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.

⁷ Codirectional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on the same side of the isolation barrier. Opposing-directional channel-to-channel matching is the absolute value of the difference in propagation delays between any two channels with inputs on opposing sides of the isolation barrier.

⁸ CM_H is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O > 0.8 V_{DD2}$. CM_L is the maximum common-mode voltage slew rate that can be sustained while maintaining $V_O < 0.8\text{ V}$. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges. The transient magnitude is the range over which the common mode is slewed.

⁹ Input enable time is the duration from when $V_{DISABLE}$ is set low until the output states are guaranteed to match the input states in the absence of any input data logic transitions. If an input data logic transition within a given channel does occur within this time interval, the output of that channel reaches the correct state within the much shorter duration, as determined by the propagation delay specifications within this data sheet. Input disable time is the duration from when $V_{DISABLE}$ is set high until the output states are guaranteed to reach their programmed output levels, as determined by the $CTRL_2$ logic state (See Table 12).

¹⁰ $I_{DDx(Q)}$ is the quiescent current drawn from the corresponding supply by a single channel. To calculate the total quiescent current, an additional inaccessible channel in the same orientation as Channel A must be included to account for the total current consumed.

¹¹ Dynamic supply current is the incremental amount of supply current required for a 1 Mbps increase in signal data rate. See Figure 6 through Figure 8 for information on per-channel supply current for unloaded and loaded conditions. See the Power Consumption section for guidance on calculating the per-channel supply current for a given data rate.

Side 2 (I_{O2})	–22 mA to +22 mA
Common-Mode Transients ⁴	–100 kV/μs to +100 kV/μs

¹ All voltages are relative to their respective ground.

² V_{DD1} and V_{DDO} refer to the supply voltages on the input and output sides of a given channel, respectively. See the PC Board Layout section.

³ See Figure 5 for maximum rated current values for various temperatures.

⁴ Refers to common-mode transients across the insulation barrier. Common-mode transients exceeding the Absolute Maximum Ratings may cause latch-up or permanent damage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

*Pin 2 and Pin 8 are internally connected, and connecting both to GND_1 is recommended.
Pin 9 and Pin 15 are internally connected, and connecting both to GND_2 is recommended.

Figure 3. ADuM1310 Pin Configuration

Table 10. ADuM1310 Pin Function Descriptions

Pin No.	Mnemonic	Description
1	V_{DD1}	Supply Voltage for Isolator Side 1, 2.7 V to 5.5 V.
2	GND_1	Ground 1. Ground reference for isolator Side 1.
3	V_{IA}	Logic Input A.
4	V_{IB}	Logic Input B.
5	V_{IC}	Logic Input C.
6	NC	No Connection.
7	DISABLE	Input Disable. Disables the isolator inputs and halts the dc refresh circuits. Outputs take on the logic state determined by $CTRL_2$.
8	GND_1	Ground 1. Ground reference for isolator Side 1.
9	GND_2	Ground 2. Ground reference for isolator Side 2.
10	$CTRL_2$	Default Output Control. Controls the logic state the outputs take on when the input power is off. V_{OA} , V_{OB} , and V_{OC} outputs are high when $CTRL_2$ is high or disconnected and V_{DD1} is off. V_{OA} , V_{OB} , and V_{OC} outputs are low when $CTRL_2$ is low and V_{DD1} is off. When V_{DD1} power is on, this pin has no effect.
11	NC	No Connection.
12	V_{OC}	Logic Output C.
13	V_{OB}	Logic Output B.
14	V_{OA}	Logic Output A.
15	GND_2	Ground 2. Ground reference for isolator Side 2.
16	V_{DD2}	Supply Voltage for Isolator Side 2, 2.7 V to 5.5 V.

ADuM1310/ADuM1311

*Pin 2 and Pin 8 are internally connected, and connecting both to GND₁ is recommended.
Pin 9 and Pin 15 are internally connected, and connecting both to GND₂ is recommended.

APPLICATION INFORMATION

PC BOARD LAYOUT

The ADuM131x digital isolator requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 13). Bypass capacitors are most conveniently connected between Pin 1 and Pin 2 for V_{DD1} and between Pin 15 and Pin 16 for V_{DD2} . The capacitor value should be between 0.01 μ F and 0.1 μ F. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 20 mm. Bypassing between Pin 1 and Pin 8 and between Pin 9 and Pin 16 should be considered, unless both of the ground pins on each package are connected together close to the package.

Figure 13. Recommended Printed Circuit Board Layout

In applications involving high common-mode transients, care should be taken to ensure that board coupling across the isolation barrier is minimized. Furthermore, the board layout should be designed such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the device's absolute maximum ratings, thereby leading to latch-up or permanent damage.

PROPAGATION DELAY RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The input-to-output propagation delay time for a high-to-low transition may differ from the propagation delay time of a low-to-high transition.

Figure 14. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the input signal's timing is preserved.

Channel-to-channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM131x component.

Propagation delay skew refers to the maximum amount the propagation delay differs between multiple ADuM131x components operating under the same conditions.

DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow (~ 1 ns) pulses to be sent to the decoder via the transformer. The decoder is bistable and is therefore either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than 2 μ s, a periodic set of refresh pulses indicative of the correct input state are sent to ensure dc correctness at the output. If the decoder receives no internal pulses of more than about 5 μ s, the input side is assumed to be unpowered or nonfunctional, in which case the isolator output is forced to a default state (see Table 12) by the watchdog timer circuit.

The magnetic field immunity of the ADuM131x is determined by the changing magnetic field, which induces a voltage in the transformer's receiving coil large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3 V operating condition of the ADuM131x is examined because it represents the most susceptible mode of operation.

The pulses at the transformer output have an amplitude greater than 1.0 V. The decoder has a sensing threshold at about 0.5 V, thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$V = (-d\beta/dt)\sum \pi r_n^2; n = 1, 2, \dots, N$$

where:

β is magnetic flux density (gauss).

N is the number of turns in the receiving coil.

r_n is the radius of the n^{th} turn in the receiving coil (cm).

Given the geometry of the receiving coil in the ADuM131x and an imposed requirement that the induced voltage be, at most, 50% of the 0.5 V margin at the decoder, a maximum allowable magnetic field at a given frequency can be calculated. The result is shown in Figure 15.

Figure 15. Maximum Allowable External Magnetic Flux Density

For example, at a magnetic field frequency of 1 MHz, the maximum allowable magnetic field of 0.2 kgauss induces a voltage of 0.25 V at the receiving coil. This is about 50% of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event were to occur during a transmitted pulse (and was of the worst-case polarity), it would reduce the received pulse from >1.0 V to 0.75 V—still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADuM131x transformers. Figure 16 expresses these allowable current magnitudes as a function of frequency for selected distances. As shown, the ADuM131x is extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example noted, one would have to place a 0.5 kA current 5 mm away from the ADuM131x to affect the component's operation.

Figure 16. Maximum Allowable Current

for Various Current-to-ADuM131x Spacings

Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces can induce error voltages sufficient to trigger succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

POWER CONSUMPTION

The supply current at a given channel of the ADuM131x isolator is a function of the supply voltage, the channel's data rate, and the channel's output load.

For each input channel, the supply current is given by

$$I_{DDI} = I_{DDI(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDI} = I_{DDI(D)} \times (2f - f_r) + I_{DDI(Q)} \quad f > 0.5 f_r$$

For each output channel, the supply current is given by

$$I_{DDO} = I_{DDO(Q)} \quad f \leq 0.5 f_r$$

$$I_{DDO} = (I_{DDO(D)} + (0.5 \times 10^{-3}) \times C_L \times V_{DDO}) \times (2f - f_r) + I_{DDO(Q)} \quad f > 0.5 f_r$$

where:

$I_{DDI(D)}$, $I_{DDO(D)}$ are the input and output dynamic supply currents per channel (mA/Mbps).

C_L is the output load capacitance (pF).

V_{DDO} is the output supply voltage (V).

f is the input logic signal frequency (MHz); it is half of the input data rate expressed in units of Mbps.

f_r is the input stage refresh rate (Mbps).

$I_{DDI(Q)}$, $I_{DDO(Q)}$ are the specified input and output quiescent supply currents (mA).

To calculate the total V_{DD1} and V_{DD2} supply current, the supply currents for each input and output channel corresponding to V_{DD1} and V_{DD2} are calculated and totaled. The ADuM131x contains an internal data channel that is not available to the user. This channel is in the same orientation as Channel A and consumes quiescent current. The contribution of this channel must be included in the total quiescent current calculation for each supply. Figure 6 and Figure 7 provide per-channel supply currents as a function of data rate for an unloaded output condition. Figure 8 provides per-channel supply current as a function of data rate for a 15 pF output condition. Figure 9 through Figure 12 provide total V_{DD1} and V_{DD2} supply current as a function of data rate for ADuM1310/ADuM1311 channel configurations.

Model	Number of Inputs, V _{DD1} Side	Number of Inputs, V _{DD2} Side	Maximum Data Rate (Mbps)	Maximum Propagation Delay, 5 V (ns)	Maximum Pulse Width Distortion (ns)	Temperature Range	Package Description	Package Option
ADuM1310ARWZ ¹	3	0	1	100	40	−40°C to +105°C	16-Lead SOIC_W	RW-16
ADuM1310ARWZ-RL ¹	3	0	1	100	40	−40°C to +105°C	16-Lead SOIC_W, 13" Reel	RW-16
ADuM1310BRWZ ¹	3	0	10	50	5	−40°C to +105°C	16-Lead SOIC_W	RW-16
ADuM1310BRWZ-RL ¹	3	0	10	50	5	−40°C to +105°C	16-Lead SOIC_W, 13" Reel	RW-16
ADuM1311ARWZ ¹	2	1	1	100	40	−40°C to +105°C	16-Lead SOIC_W	RW-16
ADuM1311ARWZ-RL ¹	2	1	1	100	40	−40°C to +105°C	16-Lead SOIC_W, 13" Reel	RW-16
ADuM1311BRWZ ¹	2	1	10	50	5	−40°C to +105°C	16-Lead SOIC_W	RW-16
ADuM1311BRWZ-RL ¹	2	1	10	50	5	−40°C to +105°C	16-Lead SOIC_W, 13" Reel	RW-16

¹ Z = Pb-free part.
