

Triple, Ultra-Fast CMOS LDO Regulator

General Description

The RT9185 series are efficient, precise triple-channel CMOS LDO regulators specifically designed for mother-board application. The device is intended to powering the standby voltage in which 3.3V_PCI, 2.5V_Clock and 1.8V_ICH2 or 1.5V_ICH4 core voltage of the PC based computer system. Moreover, it is also optimized for CD/DVD-ROM, CD/RW, XDSL Router or IA equipments applications. The regulator outputs are capable of sourcing 1.5A, 0.8A and 0.3A of output current respectively.

The RT9185 also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications. The other features include faster transient response, low dropout voltage, high output accuracy, current limiting and thermal shutdown protections.

The RT9185 regulators are available in fused SOP-8, 5-lead TO-252 and 5-lead TO-263 packages.

Ordering Information

RT9185	□	□	□
	Package Type		
	S : SOP-8		
	L5 : TO-252-5		
	M5 : TO-263-5		
	Operating Temperature Range		
	P : Pb Free with Commercial Standard		
	G : Green (Halogen Free with Commercial Standard)		
	VOUT3		
	A : 1.8V		
	B : 1.5V		
	Other voltage versions please contact RichTek for detail.		

Note :

RichTek Pb-free and Green products are :

- ▶RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶Suitable for use in SnPb or Pb-free soldering processes.
- ▶100%matte tin (Sn) plating.

Features

- Fixed Output Voltages : 3.35V at 1.5A, 2.55V at 0.8A and 1.5V or 1.8V at 0.3A
- Low Quiescent Current (Typically 0.4mA)
- Operating Voltage Ranges : 3.5V to 5.5V
- Ultra-Fast Transient Response
- Tight Load and Line Regulation
- Current Limiting Protection
- Thermal Shutdown Protection
- Only Low-ESR Ceramic Capacitors Required for Stability
- Custom Voltage Available
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- Mother-board Power Supply
- CD/DVD-ROM, CD/RW
- XDSL Router
- IA Equipments
- Cable Modems

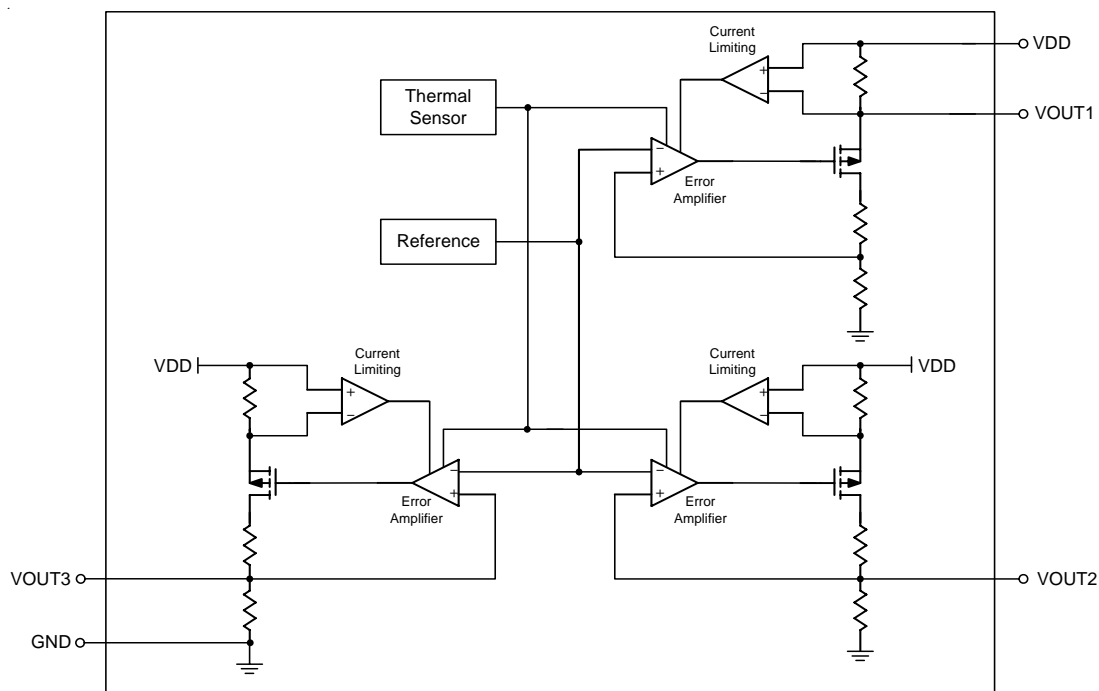

Pin Configurations

Typical Application Circuit

Function Block Diagram

Functional Pin Description

Pin Name	Pin Function
VOUT1	Channel 1 Output Voltage
VDD	Supply Input
GND	Common Ground
VOUT2	Channel 2 Output Voltage
VOUT3	Channel 3 Output Voltage

Absolute Maximum Ratings (Note 1)

- Supply Input Voltage ----- 7V
- Power Dissipation, P_D @ $T_A = 25^\circ\text{C}$
 - SOP-8 ----- 0.625W
 - TO-252-5 ----- 1.471W
 - TO-263-5 ----- 2.222W
- Package Thermal Resistance (Note 6)
 - SOP-8, θ_{JA} ----- 160°C/W
 - TO-252-5, θ_{JA} ----- 68°C/W
 - TO-263-5, θ_{JA} ----- 45°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 2)
 - HBM (Human Body Mode) ----- 2kV
 - MM (Machine Mode) ----- 200V

Recommended Operating Conditions (Note 3)

- Supply Input Voltage ----- 3.5V to 5.5V
- Junction Temperature Range ----- -40°C to 125°C

Electrical Characteristics

($V_{DD} = 5\text{V}$, $C_{IN} = 1\mu\text{F}$, $T_A = 25^\circ\text{C}$, for each LDO unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Output Voltage Accuracy	V_{OUT1}	$I_{OUT1} = 1\text{mA}$	3.315	3.35	3.415	V
	V_{OUT2}	$I_{OUT2} = 1\text{mA}$	2.525	2.55	2.60	
	V_{OUT3}	RT9185A $I_{OUT3} = 1\text{mA}$	1.782	1.8	1.836	
		RT9185B $I_{OUT3} = 1\text{mA}$	1.485	1.5	1.530	
Current Limiting	I_{LIM1}	$R_{LOAD} = 1\Omega$	1.5	1.9	--	A
	I_{LIM2}	$R_{LOAD} = 1\Omega$	0.8	1.3	--	
	I_{LIM3}	$R_{LOAD} = 1\Omega$	0.3	0.5	--	
Quiescent Current (triple LDOs) (Note 5)	I_{DD}	$I_{OUT} = 0\text{mA}$	--	0.4	0.8	mA
Dropout Voltage	ΔV_{DROP1}	$I_{OUT1} = 1.5\text{A}$	--	600	1085	mV
	ΔV_{DROP2}	$I_{OUT2} = 0.8\text{A}$	--	700	--	mV
Line Regulation (triple LDOs)	ΔV_{LINE}	$I_{OUT} = 1\text{mA}$, $V_{DD} = 4\text{V}$ to 6V	--	2	10	mV
Load Regulation (Note 4)	ΔV_{LOAD1}	V_{OUT1} , $1\text{mA} < I_{OUT1} < 1.5\text{A}$	--	30	55	mV
	ΔV_{LOAD2}	V_{OUT2} , $1\text{mA} < I_{OUT2} < 0.8\text{A}$	--	30	55	
	ΔV_{LOAD3}	V_{OUT3} , $1\text{mA} < I_{OUT3} < 0.3\text{A}$	--	20	45	
Temperature Coefficient	T_C		--	30	--	PPM
Thermal Shutdown	T_{SD}		125	165	--	$^\circ\text{C}$

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. Devices are ESD sensitive. Handling precaution recommended.

Note 3. The device is not guaranteed to function outside its operating conditions.

Note 4. Regulation is measured at constant junction temperature by using a 20ms current pulse. Devices are tested for load regulation in the load range from 1mA to 1.5A, 0.8A and 0.3A for each LDO respectively.

Note 5. Quiescent, or ground current, is the difference between input and output currents. It is defined by $I_Q = I_{IN} - I_{OUT}$ under no load condition ($I_{OUT} = 0mA$). The total current drawn from the supply is the sum of the load current plus the ground pin current.

Note 6. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard. The pad size is $100mm^2$ on TO-252 packages, $125mm^2$ on TO-263 packages.

Application Information

Like any low-dropout regulator, the RT9185 requires input and output decoupling capacitors. The device is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance (see Capacitor Characteristics Section). Please note that linear regulators with a low dropout voltage have high internal loop gains which require care in guarding against oscillation caused by insufficient decoupling capacitance.

Input Capacitor

An input capacitance of $\approx 2.2\mu\text{F}$ is required between the device input pin and ground directly (the amount of the capacitance may be increased without limit). The input capacitor **MUST** be located less than 1 cm from the device to assure input stability (see PCB Layout Section). A lower ESR capacitor allows the use of less capacitance, while higher ESR type (like aluminum electrolytic) require more capacitance.

Capacitor types (aluminum, ceramic and tantalum) can be mixed in parallel, but the total equivalent input capacitance/ESR must be defined as above to stable operation.

There are no requirements for the ESR on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be $\approx 2.2\mu\text{F}$ over the entire operating temperature range.

Output Capacitor

The RT9185 is designed specifically to work with very small ceramic output capacitors. The recommended minimum capacitance (temperature characteristics X7R, X5R, Z5U, or Y5V) are $2.2\mu\text{F}$ to $4.7\mu\text{F}$ range with $10\text{m}\Omega$ to $50\text{m}\Omega$ range ceramic capacitors between each LDO output and GND for transient stability, but it may be increased without limit. Higher capacitance values help to improve transient.

The output capacitor's ESR is critical because it forms a zero to provide phase lead which is required for loop stability.

No Load Stability

The device will remain stable and in regulation with no external load. This is specially important in CMOS RAM keep-alive applications.

Input-Output (Dropout) Voltage

A regulator's minimum input-to-output voltage differential (dropout voltage) determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the device uses a PMOS, its dropout voltage is a function of drain-to-source on-resistance, $R_{\text{DS(ON)}}$, multiplied by the load current:

$$V_{\text{DROPOUT}} = V_{\text{DD}} - V_{\text{OUT}} = R_{\text{DS(ON)}} \times I_{\text{OUT}}$$

Current Limit

The RT9185 monitors and controls the PMOS' gate voltage, limiting the output current to 1.9A, 1.3A and 0.5A (typ.) respectively. The outputs can be shorted to ground for an indefinite period of time without damaging the part.

Short-Circuit Protection

The device is short circuit protected and in the event of a peak over-current condition, the short-circuit control loop will rapidly drive the output PMOS pass element off. Once the power pass element shuts down, the control loop will rapidly cycle the output on and off until the average power dissipation causes the thermal shutdown circuit to respond to servo the on/off cycling to a lower frequency. Please refer to the section on thermal information for power dissipation calculations.

Capacitor Characteristics

It is important to note that capacitance tolerance and variation with temperature must be taken into consideration when selecting a capacitor so that the minimum required amount of capacitance is provided over the full operating temperature range. In general, a good tantalum capacitor will show very little capacitance variation with temperature, but a ceramic may not be as good (depending on dielectric type). Aluminum electrolytics also typically have large temperature variation of capacitance value.

Equally important to consider is a capacitor's ESR change with temperature: this is not an issue with ceramics, as their ESR is extremely low. However, it is very important in tantalum and aluminum electrolytic capacitors. Both show increasing ESR at colder temperatures, but the increase in aluminum electrolytic capacitors is so severe they may not be feasible for some applications.

Ceramic :

For values of capacitance in the 10 μ F to 100 μ F range, ceramics are usually larger and more costly than tantalums but give superior AC performance for by-passing high frequency noise because of very low ESR (typically less than 10m Ω). However, some dielectric types do not have good capacitance characteristics as a function of voltage and temperature.

Z5U and Y5V dielectric ceramics have capacitance that drops severely with applied voltage. A typical Z5U or Y5V capacitor can lose 60% of its rated capacitance with half of the rated voltage applied to it. The Z5U and Y5V also exhibit a severe temperature effect, losing more than 50% of nominal capacitance at high and low limits of the temperature range.

X7R and X5R dielectric ceramic capacitors are strongly recommended if ceramics are used, as they typically maintain a capacitance range within $\pm 20\%$ of nominal over full operating ratings of temperature and voltage. Of course, they are typically larger and more costly than Z5U/Y5U types for a given voltage and capacitance.

Tantalum :

Solid tantalum capacitors are recommended for use on the output because their typical ESR is very close to the ideal value required for loop compensation. They also work well as input capacitors if selected to meet the ESR requirements previously listed.

Tantalums also have good temperature stability: a good quality tantalum will typically show a capacitance value that varies less than 10~15% across the full temperature range of 125°C to -40°C. ESR will vary only about 2X going from the high to low temperature limits.

The increasing ESR at lower temperatures can cause oscillations when marginal quality capacitors are used (if the ESR of the capacitor is near the upper limit of the stability range at room temperature).

Aluminum :

This capacitor type offers the most capacitance for the money. The disadvantages are that they are larger in physical size, not widely available in surface mount, and have poor AC performance (especially at higher frequencies) due to higher ESR and ESL.

Compared by size, the ESR of an aluminum electrolytic is higher than either Tantalum or ceramic, and it also varies greatly with temperature. A typical aluminum electrolytic can exhibit an ESR increase of as much as 50X when going from 25°C down to -40°C.

It should also be noted that many aluminum electrolytics only specify impedance at a frequency of 120Hz, which indicates they have poor high frequency performance. Only aluminum electrolytics that have an impedance specified at a higher frequency (between 20kHz and 100kHz) should be used for the device. Derating must be applied to the manufacturer's ESR specification, since it is typically only valid at room temperature.

Any applications using aluminum electrolytics should be thoroughly tested at the lowest ambient operating temperature where ESR is maximum.

Thermal Considerations

The RT9185 is a triple channel CMOS regulator designed to provide two output voltage from one package. Each output pin the RT9185 can deliver a current of up to 1.5A, 0.8A and 0.3A respectively over the full operating junction temperature range. However, the maximum output current must be derated at higher ambient temperature to ensure the junction temperature does not exceed 125°C. With all possible conditions, the junction temperature must be within the range specified under operating conditions. Each regulator contributes power dissipation to the overall power dissipation of the package. Power dissipation can be calculated based on the output current and the voltage drop across each regulator.

$$P_D = (V_{DD} - V_{OUT1}) I_{OUT1} + (V_{DD} - V_{OUT2}) I_{OUT2} + (V_{DD} - V_{OUT3}) I_{OUT3} + V_{IN} I_{GND}$$

Although the device is rated for 1.5A, 0.8A and 0.3A of output current, the application may limit the amount of output current based on the total power dissipation and the ambient temperature. The final operating junction temperature for any set of conditions can be estimated by the following thermal equation:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

Where $T_{J(MAX)}$ is the maximum junction temperature of the die (125°C) and T_A is the maximum ambient temperature. θ_{JA} is the thermal resistance from the junction to the surrounding environment which is combined with $\theta_{JC} + \theta_{CA}$. Where θ_{JC} is junction to case thermal resistance which for fused SOP-8 is 20°C/W, TO-252-5 is 10°C/W and TO-263-5 is 5.5°C/W, θ_{CA} is case to ambient thermal resistance which depend on PCB board area and air flow.

PCB Layout

The RT9185 is a fixed output voltage regulator which the voltage are sensed at the output pin. A long PCB trace to load will cause a voltage drop between load and RT9185. Be careful with PCB layout which minimum the output trace length and maximum the trace width.

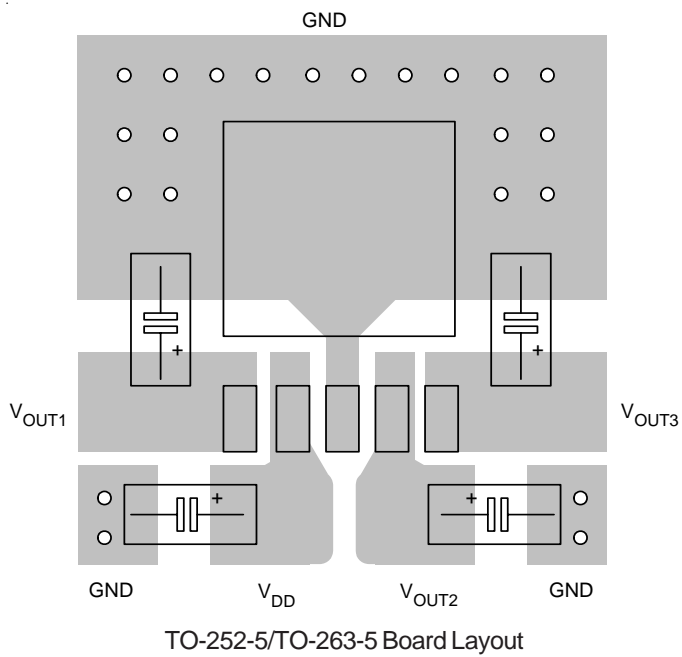

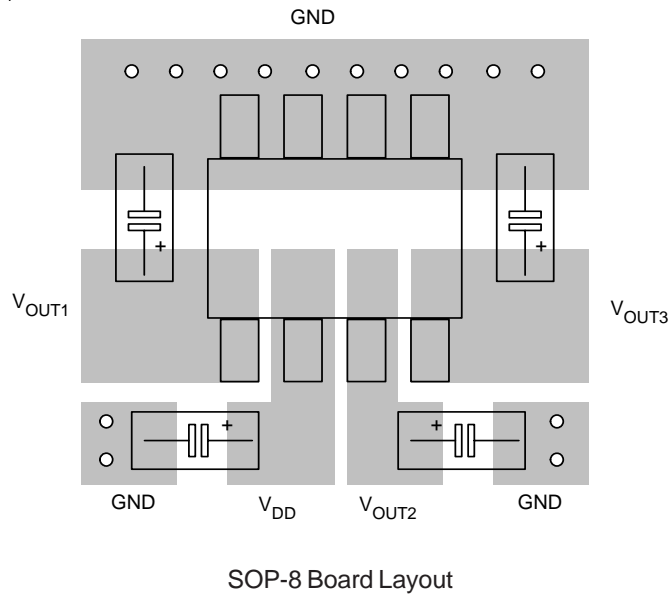

The GND pin of the RT9185 performs the dual function of providing an electrical connection to ground and channeling heat away. Connect the GND pin to ground using a large pad or ground plane.

Good board layout practices must be used or instability can be induced because of ground loops and voltage drops. The input and output capacitors **MUST** be directly connected to the input, output, and ground pins of the device using traces which have no other currents flowing through them. The best way to do this is to layout C_{IN} and C_{OUT} near the device with short traces to the V_{DD}, V_{OUT}, and ground pins.

The regulator ground pin should be connected to the external circuit ground so that the regulator and its capacitors have a "single point ground".

It should be noted that stability problems have been seen in applications where "vias" to an internal ground plane were used at the ground points of the device and the input and output capacitors. This was caused by varying ground potentials at these nodes resulting from current flowing through the ground plane. Using a single point ground technique for the regulator and its capacitors fixed the problem. Since high current flows through the traces going into V_{IN} and coming from V_{OUT}, Kelvin connect the capacitor leads to these pins so there is no voltage drop in series with the input and output capacitors.

Optimum performance can only be achieved when the device is mounted on a PC board according to the diagram below:
