

Features

- High Performance, Low Power AVR® 8-Bit Microcontroller
- Advanced RISC Architecture
 - 135 Powerful Instructions – Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers
 - Fully Static Operation
 - Up to 16 MIPS Throughput at 16 MHz
 - On-Chip 2-cycle Multiplier
- Non-volatile Program and Data Memories
 - 64/128K Bytes of In-System Self-Programmable Flash
 - Endurance: 100,000 Write/Erase Cycles
 - Optional Boot Code Section with Independent Lock Bits
 - USB Bootloader programmed by default in the Factory
 - In-System Programming by On-chip Boot Program hardware activated after reset
 - True Read-While-Write Operation
 - All supplied parts are preprogrammed with a default USB bootloader
 - 2K/4K (64K/128K Flash version) Bytes EEPROM
 - Endurance: 100,000 Write/Erase Cycles
 - 4K/8K (64K/128K Flash version) Bytes Internal SRAM
 - Up to 64K Bytes Optional External Memory Space
 - Programming Lock for Software Security
- JTAG (IEEE std. 1149.1 compliant) Interface
 - Boundary-scan Capabilities According to the JTAG Standard
 - Extensive On-chip Debug Support
 - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- USB 2.0 Full-speed/Low-speed Device and On-The-Go Module
 - Complies fully with:
 - Universal Serial Bus Specification REV 2.0
 - On-The-Go Supplement to the USB 2.0 Specification Rev 1.0
 - Supports data transfer rates up to 12 Mbit/s and 1.5 Mbit/s
- USB Full-speed/Low Speed Device Module with Interrupt on Transfer Completion
 - Endpoint 0 for Control Transfers : up to 64-bytes
 - 6 Programmable Endpoints with IN or Out Directions and with Bulk, Interrupt or Isochronous Transfers
 - Configurable Endpoints size up to 256 bytes in double bank mode
 - Fully independent 832 bytes USB DPRAM for endpoint memory allocation
 - Suspend/Resume Interrupts
 - Power-on Reset and USB Bus Reset
 - 48 MHz PLL for Full-speed Bus Operation
 - USB Bus Disconnection on Microcontroller Request
- USB OTG Reduced Host :
 - Supports Host Negotiation Protocol (HNP) and Session Request Protocol (SRP) for OTG dual-role devices
 - Provide Status and control signals for software implementation of HNP and SRP
 - Provides programmable times required for HNP and SRP
- Peripheral Features
 - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
 - Two 16-bit Timer/Counter with Separate Prescaler, Compare- and Capture Mode

Summary

7593GS-AVR-03/08

- Real Time Counter with Separate Oscillator
- Four 8-bit PWM Channels
- Six PWM Channels with Programmable Resolution from 2 to 16 Bits
- Output Compare Modulator
- 8-channels, 10-bit ADC
- Programmable Serial USART
- Master/Slave SPI Serial Interface
- Byte Oriented 2-wire Serial Interface
- Programmable Watchdog Timer with Separate On-chip Oscillator
- On-chip Analog Comparator
- Interrupt and Wake-up on Pin Change
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated Oscillator
 - External and Internal Interrupt Sources
 - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby, and Extended Standby
- I/O and Packages
 - 48 Programmable I/O Lines
 - 64-lead TQFP and 64-lead QFN
- Operating Voltages
 - 2.7 - 5.5V
- Operating temperature
 - Industrial (-40°C to +85°C)
- Maximum Frequency
 - 8 MHz at 2.7V - Industrial range
 - 16 MHz at 4.5V - Industrial range

Note: The large center pad underneath the MLF packages is made of metal and internally connected to GND. It should be soldered or glued to the board to ensure good mechanical stability. If the center pad is left unconnected, the package might loosen from the board.

1.1 Disclaimer

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

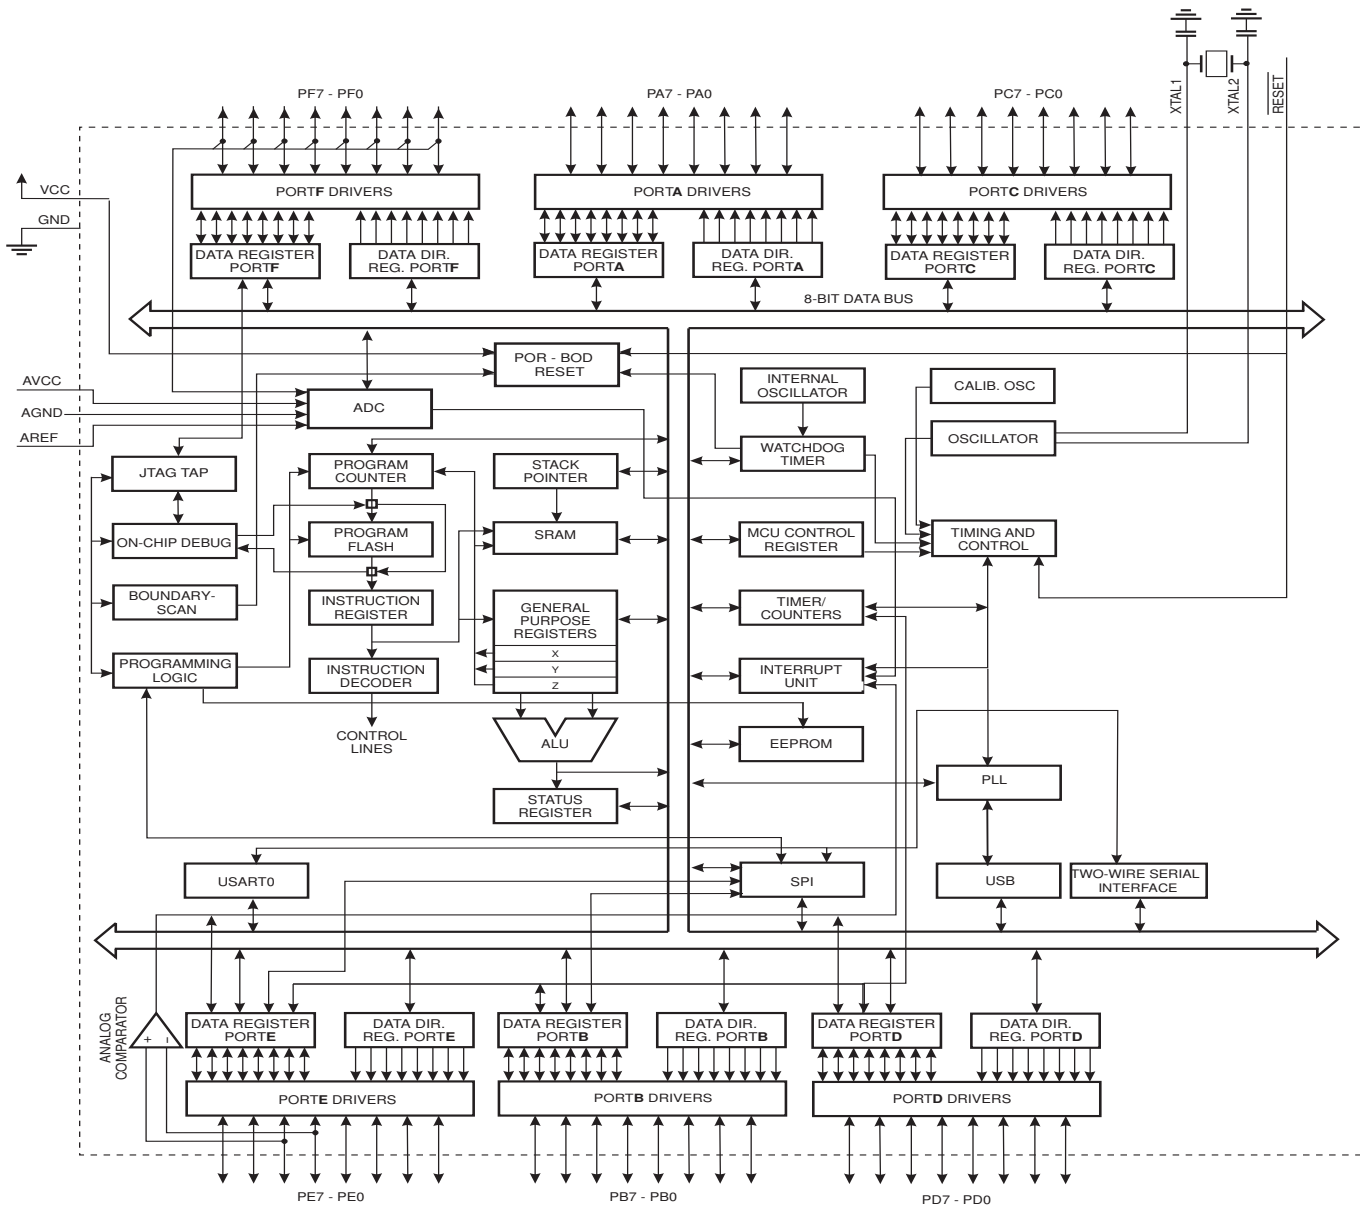

2. Overview

The AT90USB64/128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the

AT90USB64/128 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The AT90USB64/128 provides the following features: 64/128K bytes of In-System Programmable Flash with Read-While-Write capabilities, 2K/4K bytes EEPROM, 4K/8K bytes SRAM, 48 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, one USART, a byte oriented 2-wire Serial Interface, a 8-channels, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel AT90USB64/128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The AT90USB64/128 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

2.2 Pin Descriptions

2.2.1 VCC

Digital supply voltage.

2.2.2 GND

Ground.

2.2.3 Port A (PA7..PA0)

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the AT90USB64/128 as listed on [page 79](#).

2.2.4 Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the AT90USB64/128 as listed on [page 80](#).

2.2.5 Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the AT90USB64/128 as listed on [page 83](#).

2.2.6 Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the AT90USB64/128 as listed on [page 84](#).

2.2.7 Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the AT90USB64/128 as listed on [page 87](#).

2.2.8 Port F (PF7..PF0)

Port F serves as analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port F also serves the functions of the JTAG interface.

2.2.9	D-	USB Full speed / Low Speed Negative Data Upstream Port. Should be connected to the USB D- connector pin with a serial 22 Ohms resistor.
2.2.10	D+	USB Full speed / Low Speed Positive Data Upstream Port. Should be connected to the USB D+ connector pin with a serial 22 Ohms resistor.
2.2.11	UGND	USB Pads Ground.
2.2.12	UVCC	USB Pads Internal Regulator Input supply voltage.
2.2.13	UCAP	USB Pads Internal Regulator Output supply voltage. Should be connected to an external capacitor (1μF).
2.2.14	VBUS	USB VBUS monitor and OTG negotiations.
2.2.15	RESET	Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 8-1 on page 58 . Shorter pulses are not guaranteed to generate a reset.
2.2.16	XTAL1	Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.
2.2.17	XTAL2	Output from the inverting Oscillator amplifier.
2.2.18	AVCC	AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.
2.2.19	AREF	This is the analog reference pin for the A/D Converter.

3. About Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

These code examples assume that the part specific header file is included before compilation. For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI"

instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

- Note:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
 2. I/O registers within the address range \$00 - \$1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
 3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
 4. When using the I/O specific commands IN and OUT, the I/O addresses \$00 - \$3F must be used. When addressing I/O registers as data space using LD and ST instructions, \$20 must be added to these addresses. The AT90USB64/128 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from \$60 - \$1FF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

NOTES: QFN STANDARD NOTES

1. DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M. – 1994.
2. DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 mm FROM TERMINAL TIP. IF THE TERMINAL HAS THE OPTIONAL RADIUS ON THE OTHER END OF THE TERMINAL, THE DIMENSION b SHOULD NOT BE MEASURED IN THAT RADIUS AREA.
3. MAX. PACKAGE WARPAGE IS 0.05mm.
4. MAXIMUM ALLOWABLE BURRS IS 0.076 mm IN ALL DIRECTIONS.
5. PIN #1 ID ON TOP WILL BE LASER MARKED.
6. THIS DRAWING CONFORMES TO JEDEC REGISTERED OUTLINE MO-220.
7. A MAXIMUM 0.15mm PULL BACK (L1) MAY BE PRESENT.
L MINUS L1 TO BE EQUAL TO OR GREATER THAN 0.30 mm
8. THE TERMINAL #1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
THE TERMINAL #1 IDENTIFIER BE EITHER A MOLD OR MARKED FEATURE

8.2 AT90USB1287/6 First Release

- USB Eye Diagram violation in low-speed mode
- Transient perturbation in USB suspend mode generates over consumption
- VBUS Session valid threshold voltage
- USB signal rate
- VBUS residual level
- Spike on TWI pins when TWI is enabled
- High current consumption in sleep mode
- Async timer interrupt wake up from sleep generate multiple interrupts

8. USB Eye Diagram violation in low-speed mode

The low to high transition of D- violates the USB eye diagram specification when transmitting with low-speed signaling.

Problem fix/workaround

None.

7. Transient perturbation in USB suspend mode generates overconsumption

In device mode and when the USB is suspended, transient perturbation received on the USB lines generates a wake up state. However the idle state following the perturbation does not set the SUSPI bit anymore. The internal USB engine remains in suspend mode but the USB differential receiver is still enabled and generates a typical 300µA extra-power consumption. Detection of the suspend state after the transient perturbation should be performed by software (instead of reading the SUSPI bit).

Problem fix/workaround

USB waiver allows bus powered devices to consume up to 2.5mA in suspend state.

6. VBUS Session valid threshold voltage

The VSession valid threshold voltage is internally connected to VBus_Valid (4.4V approx.). That causes the device to attach to the bus only when Vbus is greater than VBusValid instead of V_Session Valid. Thus if VBUS is lower than 4.4V, the device is detached.

Problem fix/workaround

According to the USB power drop budget, this may require connecting the device to a root hub or a self-powered hub.

5. UBS signal rate

The average USB signal rate may sometime be measured out of the USB specifications (12MHz \pm 30kHz) with short frames. When measured on a long period, the average signal rate value complies with the specifications. This bit rate deviation does not generate communication or functional errors.

Problem fix/workaround

None.

4. VBUS residual level

In USB device and host mode, once a 5V level has been detected to the VBUS pad, a residual level (about 3V) can be measured on the VBUS pin.

Problem fix/workaround

None.

3. Spike on TWI pins when TWI is enabled

100 ns negative spike occurs on SDA and SCL pins when TWI is enabled.

Problem Fix/workaround

No known workaround, enable AT90USB64/128 TWI first versus the other nodes of the TWI network.

2. High current consumption in sleep mode

If a pending interrupt cannot wake the part up from the selected mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

Problem Fix/workaround

Before entering sleep, interrupts not used to wake up the part from the sleep mode should be disabled.

1. Asynchronous timer interrupt wake up from sleep generates multiple interrupts

If the CPU core is in sleep and wakes-up from an asynchronous timer interrupt and then goes back in sleep again it may wake up multiple times.

Problem Fix/workaround

A software workaround is to wait with performing the sleep instruction until $TCNT2 > OCR2 + 1$.

8.3 AT90USB1287/6 Second Release

- USB Eye Diagram violation in low-speed mode
- Transient perturbation in USB suspend mode generates over consumption
- VBUS Session valid threshold voltage
- Spike on TWI pins when TWI is enabled
- High current consumption in sleep mode
- Async timer interrupt wake up from sleep generate multiple interrupts

10. Datasheet Revision History for AT90USB64/128

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

10.1 Changes from 7593A to 7593B

1. Changed default configuration for fuse bytes and security byte.
2. Suppression of timer 4,5 registers which does not exist.
3. Updated typical application schematics in USB section

10.2 Changes from 7593B to 7593C

1. Update to package drawings, MQFP64 and TQFP64.

10.3 Changes from 7593C to 7593D

1. For further product compatibility, changed USB PLL possible prescaler configurations. Only 8MHz and 16MHz crystal frequencies allows USB operation (See [Table 6-11 on page 49](#)).

10.4 Changes from 7593D to 7593E

1. Updated PLL Prescaler table: configuration words are different between AT90USB64x and AT90USB128x to enable the PLL with a 16 MHz source.
2. Cleaned up some bits from USB registers, and updated information about OTG timers, remote wake-up, reset and connection timings.
3. Updated clock distribution tree diagram (USB prescaler source and configuration register).
4. Cleaned up register summary.
5. Suppressed PCINT23:8 that do not exist from External Interrupts.
6. Updated Electrical Characteristics.
7. Added Typical Characteristics.
8. Update Errata section.

10.5 Changes from 7593E to 7593F

1. Removed 'Preliminary' from document status.
2. Clarification in Stand by mode concerning USB. See ["Standby Mode" on page 53](#).

10.6 Changes from 7593F to 7593G

1. Updated Errata section.
