Description

The ispLSI 2192VE is a High Density Programmable Logic Device containing 192 Registers, nine or twelve Dedicated Input pins, three Dedicated Clock Input pins, two dedicated Global OE input pins and a Global Routing Pool (GRP). The GRP provides complete interconnectivity between all of these elements. The ispLSI 2192VE features in-system programmability through the Boundary Scan Test Access Port (TAP) and is 100% IEEE 1149.1 Boundary Scan Testable. The ispLSI 2192VE offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 2192VE device is the Generic Logic Block (GLB). The GLBs are labeled A0, A1 .. F7 (see Figure 1). There are a total of 48 GLBs in the ispLSI 2192VE device. Each GLB is made up of four macrocells. Each GLB has 18 inputs, a programmable AND/OR/Exclusive OR array, and four outputs which can be configured to be either combinatorial or registered. Inputs to the GLB come from the GRP and dedicated inputs. All of the GLB outputs are brought back into the GRP so that they can be connected to the inputs of any GLB on the device.

Table 2-0042A/2192VE v0.1

Power Consumption

Power consumption in the ispLSI 2192VE device depends on two primary factors: the speed at which the device is operating and the number of Product Terms used. Figure 3 shows the relationship between power and operating speed.

Figure 3. Typical Device Power Consumption vs fmax

Notes: Configuration of twelve 16-bit counters
Typical current at 3.3V, 25° C

ICC can be estimated for the ispLSI 2192VE using the following equation:

$$I_{CC} = 25 + (\# \text{ of PTs} * 0.670) + (\# \text{ of nets} * \text{max freq} * 0.0051)$$

Where:

- # of PTs = Number of Product Terms used in design
- # of nets = Number of Signals used in device
- Max freq = Highest Clock Frequency to the device (in MHz)

The ICC estimate is based on typical conditions (VCC = 3.3V, room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

Signal Descriptions

Signal Name	Description
RESET	Active Low (0) Reset pin resets all the registers in the device.
GOE 0, GOE1	Global Output Enable input pins.
Y0, Y1, Y2	Dedicated Clock Input – These clock inputs are connected to one of the clock inputs of all the GLBs in the device.
BSCAN	Input – Dedicated in-system programming Boundary Scan enable input pin. This pin is brought low to enable the programming mode. The TMS, TDI, TDO and TCK controls become active.
