## 74LCX543

### Low Voltage Octal Registered Transceiver with 5V Tolerant Inputs and Outputs

#### General Description

The LCX543 is a non-inverting octal transceiver containing two sets of D-type registers for temporary storage of data flowing in either direction. Separate Latch Enable and Output Enable inputs are provided for each register to permit independent input and output control in either direction of data flow.

The LCX543 is designed for low voltage (2.5V or 3.3V)  $V_{CC}$  applications with capability of interfacing to a 5V signal environment.

The LCX543 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

#### Features

- 5V tolerant inputs and outputs
- 2.3V – 3.6V  $V_{CC}$  specifications provided
- 7.0 ns  $t_{PD}$  max ( $V_{CC} = 3.3V$ ), 10  $\mu A$   $I_{CC}$  max
- Power down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- $\pm 24$  mA Output Drive ( $V_{CC} = 3.0V$ )
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance:
  - Human body model > 2000V
  - Machine model > 200V

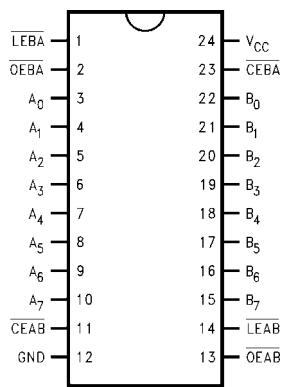

**Note 1:** To ensure the high-impedance state during power up or down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pull-up resistor: the minimum value or the resistor is determined by the current-sourcing capability of the driver.

## Functional Description

The LCX543 contains two sets of eight D-type latches, with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ( $\overline{\text{CEAB}}$ ) input must be LOW in order to enter data from  $A_0$ - $A_7$  or take data from  $B_0$ - $B_7$ , as indicated in the Data I/O Control Table. With  $\overline{\text{CEAB}}$  LOW, a LOW signal on the A-to-B Latch Enable ( $\overline{\text{LEAB}}$ ) input makes the A-to-B latches transparent; a subsequent LOW-to-HIGH transition of the  $\overline{\text{LEAB}}$  signal puts the A latches in the storage mode and their outputs no longer change with the A inputs. With  $\overline{\text{CEAB}}$  and  $\overline{\text{OEAB}}$  both LOW, the 3-STATE B output buffers are active and reflect the data present at the output of the A latches. Control of data flow from B to A is similar, but using the CEBA, LEBA and  $\overline{\text{OEBA}}$  inputs.
