

## Features

- High Performance, Low Power 32-bit AVR<sup>®</sup> Microcontroller
  - Compact Single-Cycle RISC Instruction Set Including DSP Instructions
  - Read-Modify-Write Instructions and Atomic Bit Manipulation
  - Performance
    - Up to 64 DMIPS Running at 50MHz from Flash (1 Flash Wait State)
    - Up to 36 DMIPS Running at 25MHz from Flash (0 Flash Wait State)
  - Memory Protection Unit (MPU)
    - Secure Access Unit (SAU) providing user defined peripheral protection
- picoPower<sup>®</sup> Technology for Ultra-Low Power Consumption
- Multi-Hierarchy Bus System
  - High-Performance Data Transfers on Separate Buses for Increased Performance
  - 12 Peripheral DMA Channels Improve Speed for Peripheral Communication
- Internal High-Speed Flash
  - 64Kbytes, 32Kbytes, and 16Kbytes Versions
  - Single-Cycle Access up to 25MHz
  - FlashVault<sup>™</sup> Technology Allows Pre-programmed Secure Library Support for End User Applications
  - Prefetch Buffer Optimizing Instruction Execution at Maximum Speed
  - 100,000 Write Cycles, 15-year Data Retention Capability
  - Flash Security Locks and User Defined Configuration Area
- Internal High-Speed SRAM, Single-Cycle Access at Full Speed
  - 16Kbytes (64Kbytes and 32Kbytes Flash), or 8Kbytes (16Kbytes Flash)
- Interrupt Controller (INTC)
  - Autovector Low Latency Interrupt Service with Programmable Priority
- External Interrupt Controller (EIC)
- Peripheral Event System for Direct Peripheral to Peripheral Communication
- System Functions
  - Power and Clock Manager
  - SleepWalking<sup>™</sup> Power Saving Control
  - Internal System RC Oscillator (RCSYS)
  - 32 KHz Oscillator
  - Multipurpose Oscillator and Digital Frequency Locked Loop (DFLL)
- Windowed Watchdog Timer (WDT)
- Asynchronous Timer (AST) with Real-Time Clock Capability
  - Counter or Calendar Mode Supported
- Frequency Meter (FREQM) for Accurate Measuring of Clock Frequency
- Six 16-bit Timer/Counter (TC) Channels
  - External Clock Inputs, PWM, Capture and Various Counting Capabilities
- PWM Channels on All I/O Pins (PWMA)
  - 8-bit PWM up to 150MHz Source Clock
- Four Universal Synchronous/Asynchronous Receiver/Transmitters (USART)
  - Independent Baudrate Generator, Support for SPI
  - Support for Hardware Handshaking
- One Master/Slave Serial Peripheral Interfaces (SPI) with Chip Select Signals
  - Up to 15 SPI Slaves can be Addressed
- Two Master and Two Slave Two-Wire Interfaces (TWI), 400kbit/s I<sup>2</sup>C-compatible
- One 8-channel Analog-To-Digital Converter (ADC) with up to 12 Bits Resolution
  - Internal Temperature Sensor

## 32-bit AVR<sup>®</sup> Microcontroller

**AT32UC3L064**  
**AT32UC3L032**  
**AT32UC3L016**

**Preliminary**

**Summary**

32099DS-06/2010

- Eight Analog Comparators (AC) with Optional Window Detection
- Capacitive Touch (CAT) Module
  - Hardware Assisted QTouch® and QMatrix® Touch Acquisition
  - Supports QTouch® and QMatrix® Capture from Capacitive Touch Sensors
- QTouch® Library Support
  - Capacitive Touch Buttons, Sliders, and Wheels
  - QTouch® and QMatrix® Acquisition
- On-Chip Non-Intrusive Debug System
  - Nexus Class 2+, Runtime Control, Non-Intrusive Data and Program Trace
  - aWire™ Single-Pin Programming Trace and Debug Interface Muxed with Reset Pin
  - NanoTrace™ Provides Trace Capabilities through JTAG™ or aWire Interface
- 48-pin TQFP/QFN/TLLGA (36 GPIO Pins)
- Five High-Drive I/O Pins
- Single 1.62-3.6V Power Supply

## 1. Description

The AT32UC3L is a complete System-On-Chip microcontroller based on the AVR32 UC RISC processor running at frequencies up to 50MHz. AVR32 UC is a high-performance 32-bit RISC microprocessor core, designed for cost-sensitive embedded applications, with particular emphasis on low power consumption, high code density, and high performance.

The processor implements a Memory Protection Unit (MPU) and a fast and flexible interrupt controller for supporting modern operating systems and real-time operating systems. The Secure Access Unit (SAU) is used together with the MPU to provide the required security and integrity.

Higher computation capability is achieved using a rich set of DSP instructions.

The AT32UC3L embeds state-of-the-art picoPower technology for ultra-low power consumption. Combined power control techniques are used to bring active current consumption down to 165 $\mu$ A/MHz, and leakage down to 9nA while still retaining a bank of backup registers. The device allows a wide range of trade-offs between functionality and power consumption, giving the user the ability to reach the lowest possible power consumption with the feature set required for the application.

The Peripheral Direct Memory Access (DMA) controller enables data transfers between peripherals and memories without processor involvement. The Peripheral DMA controller drastically reduces processing overhead when transferring continuous and large data streams.

The AT32UC3L incorporates on-chip Flash and SRAM memories for secure and fast access. The FlashVault technology allows secure libraries to be programmed into the device. The secure libraries can be executed while the CPU is in Secure State, but not read by non-secure software in the device. The device can thus be shipped to end customers, who will be able to program their own code into the device, accessing the secure libraries, but without risk of compromising the proprietary secure code.

The Peripheral Event System allows peripherals to receive, react to, and send peripheral events without CPU intervention. Asynchronous interrupts allow advanced peripheral operation in low power sleep modes.

The Power Manager improves design flexibility and security. The Power Manager supports SleepWalking functionality, by which a module can be selectively activated based on peripheral events, even in sleep modes where the module clock is stopped. Power monitoring is supported by on-chip Power-On Reset (POR), Brown-Out Detector (BOD), and Supply Monitor (SM). The device features several oscillators, such as Digital Frequency Locked Loop (DFLL), Oscillator 0 (OSC0), and system RC oscillator (RCSYS). Either of these oscillators can be used as source for the system clock. The DFLL is a programmable internal oscillator from 40 to 150MHz. It can be tuned to a high accuracy if an accurate oscillator is running, e.g. the 32KHz crystal oscillator.

The Watchdog Timer (WDT) will reset the device unless it is periodically serviced by the software. This allows the device to recover from a condition that has caused the system to be unstable.

The Asynchronous Timer (AST) combined with the 32KHz crystal oscillator supports powerful real-time clock capabilities, with a maximum timeout of up to 136 years. The AST can operate in counter mode or calendar mode.

The Frequency Meter (FREQM) allows accurate measuring of a clock frequency by comparing it to a known reference clock.

The device includes six identical 16-bit Timer/Counter (TC) channels. Each channel can be independently programmed to perform frequency measurement, event counting, interval measurement, pulse generation, delay timing, and pulse width modulation.

The Pulse Width Modulation controller (PWMA) provides 8-bit PWM channels which can be synchronized and controlled from a common timer. One PWM channel is available for each I/O pin on the device, enabling applications that require multiple PWM outputs, such as LCD backlight control. The PWM channels can operate independently, with duty cycles set independently from each other, or in interlinked mode, with multiple channels changed at the same time.

The AT32UC3L also features many communication interfaces for communication intensive applications like USART, SPI, or TWI.

A general purpose 8-channel ADC is provided, as well as eight analog comparators (AC). The ADC can operate in 10-bit mode at full speed or in enhanced mode at reduced speed, offering up to 12-bit resolution. The ADC also provides an internal temperature sensor input channel. The analog comparators can be paired to detect when the sensing voltage is within or outside the defined reference window.

The Capacitive Touch (CAT) module senses touch on external capacitive touch sensors, using the QTouch technology. Capacitive touch sensors use no external mechanical components, unlike normal push buttons, and therefore demand less maintenance in the user application. The CAT module allows up to 17 touch sensors, or up to 16 by 8 matrix sensors to be interfaced. One touch sensor can be configured to operate autonomously without software interaction, allowing wakeup from sleep modes when activated.

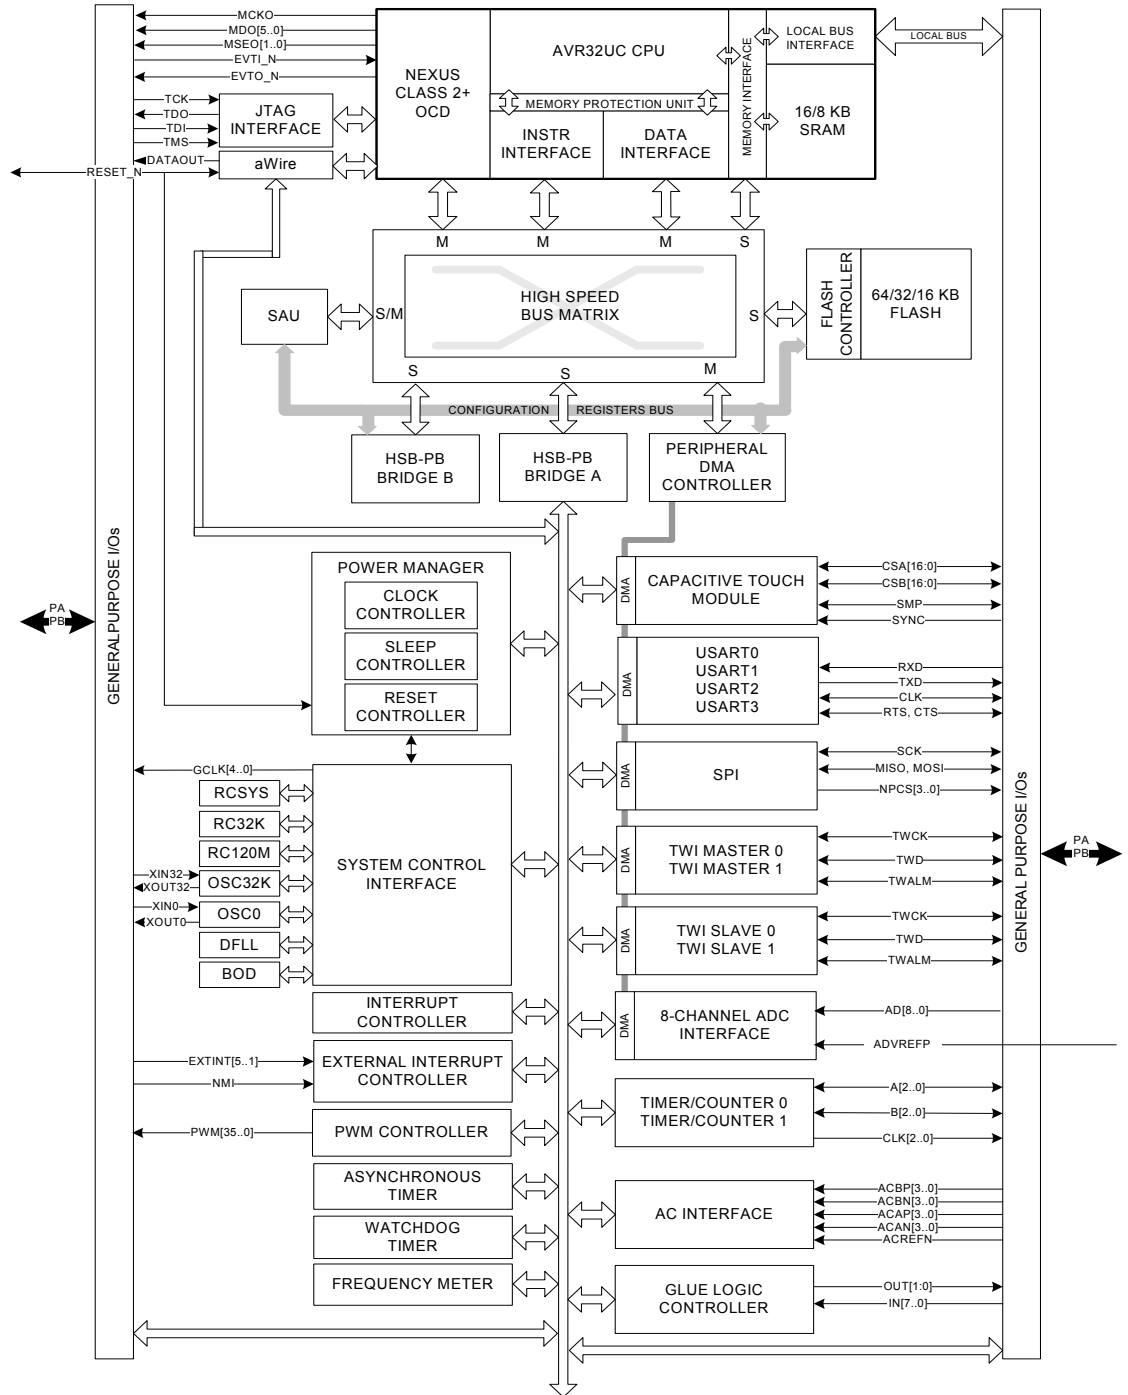

Atmel offers the QTouch library for embedding capacitive touch buttons, sliders, and wheels functionality into AVR microcontrollers. The patented charge-transfer signal acquisition offers robust sensing and included fully debounced reporting of touch keys and includes Adjacent Key Suppression® (AKS®) technology for unambiguous detection of key events. The easy-to-use QTouch Suite toolchain allows you to explore, develop, and debug your own touch applications.

The AT32UC3L integrates a class 2+ Nexus 2.0 On-Chip Debug (OCD) System, with non-intrusive real-time trace, full-speed read/write memory access, in addition to basic runtime control. The NanoTrace interface enables trace feature for aWire- or JTAG-based debuggers. The single-pin aWire interface allows all features available through the JTAG interface to be accessed through the RESET pin, allowing the JTAG pins to be used for GPIO or peripherals.

## 2. Overview

### 2.1 Block Diagram

Figure 2-1. Block Diagram

## 2.2 Configuration Summary

**Table 2-1.** Configuration Summary

Feature	AT32UC3L064	AT32UC3L032	AT32UC3L016
Flash	64KB	32KB	16KB
SRAM	16KB	16KB	8KB
GPIO	36		
High-drive pins	5		
External Interrupts	6		
TWI	2		
USART	4		
Peripheral DMA Channels	12		
Peripheral Event System	1		
SPI	1		
Asynchronous Timers	1		
Timer/Counter Channels	6		
PWM channels	36		
Frequency Meter	1		
Watchdog Timer	1		
Power Manager	1		
Secure Access Unit	1		
Glue Logic Controller	1		
Oscillators	Digital Frequency Locked Loop 40-150 MHz (DFLL) Crystal Oscillator 3-16 MHz (OSC0) Crystal Oscillator 32 KHz (OSC32K) RC Oscillator 120MHz (RC120M) RC Oscillator 115 kHz (RCSYS) RC Oscillator 32 kHz (RC32K)		
ADC	8-channel 12-bit		
Temperature Sensor	1		
Analog Comparators	8		
Capacitive Touch Module	1		
JTAG	1		
aWire	1		
Max Frequency	50 MHz		
Package	TQFP48/QFN48/TLLGA48		

### 3. Package and Pinout

#### 3.1 Package

The device pins are multiplexed with peripheral functions as described in [Section 3.2](#).

Figure 3-1. TQFP48/QFN48 Pinout

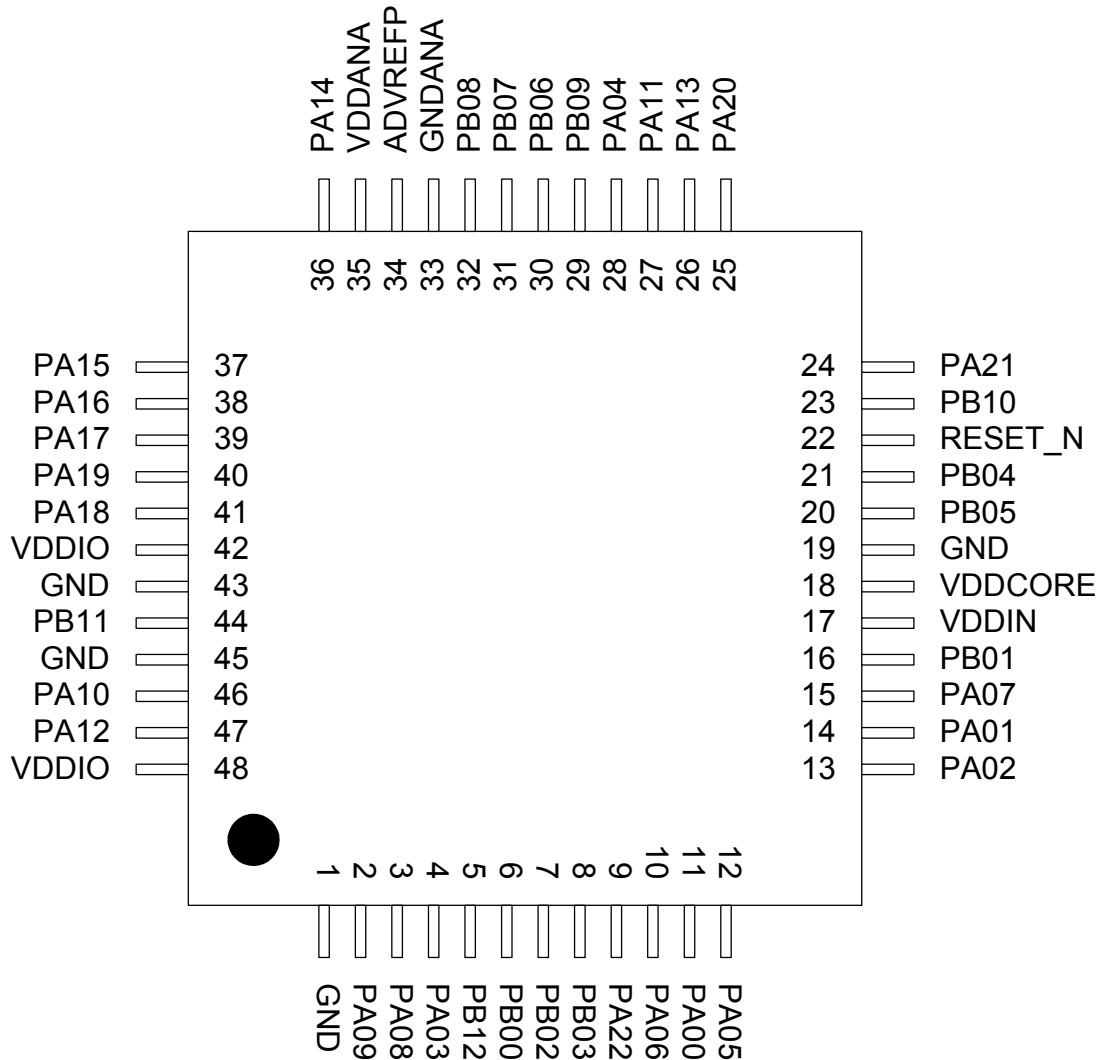

Figure 3-2. TLLGA48 Pinout

## 3.2 Peripheral Multiplexing on I/O lines

### 3.2.1 Multiplexed signals

Each GPIO line can be assigned to one of the peripheral functions. The following table describes the peripheral signals multiplexed to the GPIO lines.

**Table 3-1. GPIO Controller Function Multiplexing**

Q F P 48	PIN	G P I O	Supply	Pad Type	GPIO Function							
					A	B	C	D	E	F	G	H
11	PA00	0	VDDIO	Normal I/O	USART0-TXD	USART1-RTS	SPI-NPCS[2]		PWMA-PWMA[0]		SCIF-GCLK[0]	CAT-CSA[2]
14	PA01	1	VDDIO	Normal I/O	USART0-RXD	USART1-CTS	SPI-NPCS[3]	USART1-CLK	PWMA-PWMA[1]	ACIFB-ACAP[0]	TWIMS0-TWALM	CAT-CSA[1]
13	PA02	2	VDDIO	High-drive I/O	USART0-RTS	ADCIFB-TRIGGER	USART2-TXD	TC0-A0	PWMA-PWMA[2]	ACIFB-ACBP[0]	USART0-CLK	CAT-CSA[3]
4	PA03	3	VDDIO	Normal I/O	USART0-CTS	SPI-NPCS[1]	USART2-TXD	TC0-B0	PWMA-PWMA[3]	ACIFB-ACBN[3]	USART0-CLK	CAT-CSB[3]
28	PA04	4	VDDIO	Normal I/O	SPI-MISO	TWIMS0-TWCK	USART1-RXD	TC0-B1	PWMA-PWMA[4]	ACIFB-ACBP[1]		CAT-CSA[7]

See [Section 3.3](#) for a description of the various peripheral signals.

Signals are prioritized according to the function priority listed in [Table 3-2 on page 11](#) if multiple functions are enabled simultaneously.

Refer to ["Electrical Characteristics" on page 41](#) for a description of the electrical properties of the pad types used.

### 3.2.2 Peripheral Functions

Each GPIO line can be assigned to one of several peripheral functions. The following table describes how the various peripheral functions are selected. The last listed function has priority in case multiple functions are enabled.

**Table 3-2.** Peripheral Functions

Function	Description
A	GPIO peripheral selection A
B	GPIO peripheral selection B
C	GPIO peripheral selection C
D	GPIO peripheral selection D
E	GPIO peripheral selection E
F	GPIO peripheral selection F
G	GPIO peripheral selection G
H	GPIO peripheral selection H

### 3.2.3 JTAG Port Connections

If the JTAG is enabled, the JTAG will take control over a number of pins, irrespectively of the I/O Controller configuration.

**Table 3-3.** JTAG Pinout

48TQFP/QFN/TLLGA	Pin	JTAG Function
11	PA00	TCK
14	PA01	TMS
13	PA02	TDO
4	PA03	TDI

### 3.2.4 Nexus OCD AUX Port Connections

If the OCD trace system is enabled, the trace system will take control over a number of pins, irrespectively of the I/O Controller configuration. Two different OCD trace pin mappings are possible, depending on the configuration of the OCD AXS register. For details, see the AVR32 UC Technical Reference Manual.

**Table 3-4.** Nexus OCD AUX Port Connections

Pin	AXS=1	AXS=0
EVTI_N	PA05	PB08
MDO[5]	PA10	PB00
MDO[4]	PA18	PB04
MDO[3]	PA17	PB05

**Table 3-4.** Nexus OCD AUX Port Connections

Pin	AXS=1	AXS=0
MDO[2]	PA16	PB03
MDO[1]	PA15	PB02
MDO[0]	PA14	PB09
EVTO_N	PA04	PA04
MCKO	PA06	PB01
MSEO[1]	PA07	PB11
MSEO[0]	PA11	PB12

### 3.2.5 Oscillator Pinout

The oscillators are not mapped to the normal GPIO functions and their muxings are controlled by registers in the System Control Interface (SCIF). Please refer to the SCIF chapter for more information about this.

**Table 3-5.** Oscillator Pinout

48TQFP/QFN/TLLGA	Pin	Oscillator Function
3	PA08	XIN0
46	PA10	XIN32
26	PA13	XIN32_2
2	PA09	XOUT0
47	PA12	XOUT32
25	PA20	XOUT32_2

### 3.2.6 Other Functions

The functions listed in [Table 3-6](#) are not mapped to the normal GPIO functions. The aWire DATA pin will only be active after the aWire is enabled. The aWire DATAOUT pin will only be active after the aWire is enabled and the 2\_PIN\_MODE command has been sent. The WAKE\_N pin is always enabled. Please refer to [Section 6.1.4 on page 40](#) for constraints on the WAKE\_N pin.

**Table 3-6.** Other Functions

48TQFP/QFN/TLLGA	Pin	Function
27	PA11	WAKE_N
22	RESET_N	aWire DATA
11	PA00	aWire DATAOUT

### 3.3 Signal Descriptions

The following table gives details on signal name classified by peripheral.

**Table 3-7.** Signal Descriptions List

Signal Name	Function	Type	Active Level	Comments
<b>Analog Comparator Interface - ACIFB</b>				
ACAN3 - ACAN0	Negative inputs for comparators "A"	Analog		
ACAP3 - ACAP0	Positive inputs for comparators "A"	Analog		
ACBN3 - ACBN0	Negative inputs for comparators "B"	Analog		
ACBP3 - ACBP0	Positive inputs for comparators "B"	Analog		
ACREFN	Common negative reference	Analog		
<b>ADC Interface - ADCIFB</b>				
AD8 - AD0	Analog Signal	Analog		
ADP1 - ADP0	Drive Pin for resistive touch screen	Output		
PRND	Pseudorandom output signal	Output		
TRIGGER	External trigger	Input		
<b>aWire - AW</b>				
DATA	aWire data	I/O		
DATAOUT	aWire data output for 2-pin mode	I/O		
<b>Capacitive Touch Module - CAT</b>				
CSA16 - CSA0	Capacitive Sense A	I/O		
CSB16 - CSB0	Capacitive Sense B	I/O		
SMP	SMP signal	Output		
SYNC	Synchronize signal	Input		
VDIVEN	Voltage divider enable	Output		
<b>External Interrupt Controller - EIC</b>				
NMI	Non-Maskable Interrupt	Input		
EXTINT5 - EXTINT1	External interrupt	Input		
<b>Glue Logic Controller - GLOC</b>				
IN7 - IN0	Inputs to lookup tables	Input		
OUT1 - OUT0	Outputs from lookup tables	Output		
<b>JTAG module - JTAG</b>				
TCK	Test Clock	Input		
TDI	Test Data In	Input		
TDO	Test Data Out	Output		
TMS	Test Mode Select	Input		

**Table 3-7.** Signal Descriptions List

<b>Power Manager - PM</b>				
RESET_N	Reset	Input	Low	
<b>Pulse Width Modulation Controller - PWMA</b>				
PWMA35 - PWMA0	PWMA channel waveforms	Output		
PWMAOD35 - PWMAOD0	PWMA channel waveforms, open drain mode	Output		Not all channels support open drain mode
<b>System Control Interface - SCIF</b>				
GCLK4 - GCLK0	Generic Clock Output	Output		
RC32OUT	RC32K output at startup	Output		
XIN0	Crystal 0 Input	Analog/ Digital		
XIN32	Crystal 32 Input (primary location)	Analog/ Digital		
XIN32_2	Crystal 32 Input (secondary location)	Analog/ Digital		
XOUT0	Crystal 0 Output	Analog		
XOUT32	Crystal 32 Output (primary location)	Analog		
XOUT32_2	Crystal 32 Output (secondary location)	Analog		
<b>Serial Peripheral Interface - SPI</b>				
MISO	Master In Slave Out	I/O		
MOSI	Master Out Slave In	I/O		
NPCS3 - NPCS0	SPI Peripheral Chip Select	I/O	Low	
SCK	Clock	I/O		
<b>Timer/Counter - TC0, TC1</b>				
A0	Channel 0 Line A	I/O		
A1	Channel 1 Line A	I/O		
A2	Channel 2 Line A	I/O		
B0	Channel 0 Line B	I/O		
B1	Channel 1 Line B	I/O		
B2	Channel 2 Line B	I/O		
CLK0	Channel 0 External Clock Input	Input		
CLK1	Channel 1 External Clock Input	Input		
CLK2	Channel 2 External Clock Input	Input		
<b>Two-wire Interface - TWIM0, TWIM1</b>				
TWALM	SMBus SMBALERT	I/O	Low	
TWCK	Two-wire Serial Clock	I/O		
TWD	Two-wire Serial Data	I/O		
<b>Universal Synchronous/Asynchronous Receiver/Transmitter - USART0, USART1, USART2, USART3</b>				

**Table 3-7.** Signal Descriptions List

CLK	Clock	I/O		
CTS	Clear To Send	Input	Low	
RTS	Request To Send	Output	Low	
RXD	Receive Data	Input		
TXD	Transmit Data	Output		

Note: 1. ADCIFB: AD3 does not exist.

**Table 3-8.** Signal Description List, continued

Signal Name	Function	Type	Active Level	Comments
<b>Power</b>				
VDDCORE	Core Power Supply / Voltage Regulator Output	Power Input/Output		1.62V to 1.98V
VDDIO	I/O Power Supply	Power Input		1.62V to 3.6V. VDDIO should always be equal to or lower than VDDIN.
VDDANA	Analog Power Supply	Power Input		1.62V to 1.98V
ADVREFP	Analog Reference Voltage	Power Input		TBD to 1.98V
VDDIN	Voltage Regulator Input	Power Input		1.62V to 3.6V <sup>(1)</sup>
GNDANA	Analog Ground	Ground		
GND	Ground	Ground		
<b>Auxiliary Port - AUX</b>				
MCKO	Trace Data Output Clock	Output		
MDO5 - MDO0	Trace Data Output	Output		
MSE01 - MSE00	Trace Frame Control	Output		
EVTI_N	Event In	Input	Low	
EVTO_N	Event Out	Output	Low	
<b>General Purpose I/O pin</b>				
PA22 - PA00	Parallel I/O Controller I/O Port 0	I/O		
PB12 - PB00	Parallel I/O Controller I/O Port 1	I/O		

1. See [Section 6.1 on page 36](#)

## 3.4 I/O Line Considerations

### 3.4.1 JTAG Pins

The JTAG is enabled if TCK is low while the RESET\_N pin is released. The TCK, TMS, and TDI pins have pull-up resistors when JTAG is enabled. The TCK pin always have pull-up enabled during reset. The TDO pin is an output, driven at VDDIO, and has no pull-up resistor. The JTAG pins can be used as GPIO pins and multiplexed with peripherals when the JTAG is disabled. Please refer to [Section 3.2.3 on page 11](#) for the JTAG port connections.

### 3.4.2 PA00

Note that PA00 is multiplexed with TCK. PA00 GPIO function must only be used as output in the application.

### 3.4.3 RESET\_N Pin

The RESET\_N pin is a schmitt input and integrates a permanent pull-up resistor to VDDIN. As the product integrates a power-on reset detector, the RESET\_N pin can be left unconnected in case no reset from the system needs to be applied to the product.

The RESET\_N pin is also used for the aWire debug protocol. When the pin is used for debugging, it must not be driven by external circuitry.

### 3.4.4 TWI0 Pins

When these pins are used for TWI, the pins are open-drain outputs with slew-rate limitation and inputs with spike filtering. When used as GPIO pins or used for other peripherals, the pins have the characteristics indicated in the Electrical Characteristics section. Selected pins are also SMBus compliant (refer to [Section 3.2 on page 9](#)). As required by the SMBus specification, these pins provide no leakage path to ground when the AT32UC3L is powered down. This allows other devices on the SMBus to continue communicating even though the AT32UC3L is not powered. This feature is only available when pins PA21/PB04/PB05 are used for TWI0.

### 3.4.5 TWI1 Pins

When these pins are used for TWI, the pins are open-drain outputs with slew-rate limitation and inputs with spike filtering. When used as GPIO pins or used for other peripherals, the pins have the same characteristics as other GPIO pins.

### 3.4.6 GPIO Pins

All the I/O lines integrate a pull-up resistor. Programming of this pull-up resistor is performed independently for each I/O line through the GPIO Controllers. After reset, I/O lines default as inputs with pull-up resistors disabled, except PA00. PA20 selects SCIF-RC32OUT (GPIO Function F) as default enabled after reset.

### 3.4.7 High-Drive Pins

The five pins PA02, PA06, PA08, PA09, and PB01 have high-drive output capabilities. Refer to [Section 7. on page 41](#) for electrical characteristics.

### 3.4.8 RC32OUT Pin

#### 3.4.8.1 Clock output at startup

After power-up, the clock generated by the 32kHz RC oscillator (RC32K) will be output on PA20, even when the device is still reset by the Power-On Reset Circuitry. This clock can be used by

the system to start other devices or to clock a switching regulator to rise the power supply voltage up to an acceptable value.

The clock will be available on PA20 until one of the following conditions are true:

- PA20 is configured to use a GPIO function other than F (SCIF-RC32OUT)
- PA20 is configured as a General Purpose Input/Output (GPIO)
- The bit FRC32 in the Power Manager PPCR register is written to zero (refer to the Power Manager chapter)

The maximum amplitude of the clock signal will be defined by VDDIN.

#### 3.4.8.2 *XOUT32\_2 function*

PA20 selects RC32OUT as default enabled after reset. This function is not automatically disabled when the user enables the XOUT32\_2 function on PA20. This disturbs the oscillator and may result in the wrong frequency. To avoid this, RC32OUT must be disabled when XOUT32\_2 is enabled.

#### 3.4.9 **ADC Input Pins**

These pins are regular I/O pins powered from the VDDIO. However, when these pins are used for ADC inputs, the voltage applied to the pin must not exceed 1.98V. Internal circuitry ensures that the pin cannot be used as an analog input pin when the I/O drives to VDD. When the pins are not used for ADC inputs, the pins may be driven to the full I/O voltage range.

## 4. Processor and Architecture

Rev: 2.1.0.0

This chapter gives an overview of the AVR32UC CPU. AVR32UC is an implementation of the AVR32 architecture. A summary of the programming model, instruction set, and MPU is presented. For further details, see the *AVR32 Architecture Manual* and the *AVR32UC Technical Reference Manual*.

### 4.1 Features

- **32-bit load/store AVR32A RISC architecture**
  - 15 general-purpose 32-bit registers
  - 32-bit Stack Pointer, Program Counter and Link Register reside in register file
  - Fully orthogonal instruction set
  - Privileged and unprivileged modes enabling efficient and secure operating systems
  - Innovative instruction set together with variable instruction length ensuring industry leading code density
  - DSP extension with saturating arithmetic, and a wide variety of multiply instructions
- **3-stage pipeline allowing one instruction per clock cycle for most instructions**
  - Byte, halfword, word, and double word memory access
  - Multiple interrupt priority levels
- **MPU allows for operating systems with memory protection**
- **Secure State for supporting FlashVault™ technology**

### 4.2 AVR32 Architecture

AVR32 is a new, high-performance 32-bit RISC microprocessor architecture, designed for cost-sensitive embedded applications, with particular emphasis on low power consumption and high code density. In addition, the instruction set architecture has been tuned to allow a variety of microarchitectures, enabling the AVR32 to be implemented as low-, mid-, or high-performance processors. AVR32 extends the AVR family into the world of 32- and 64-bit applications.

Through a quantitative approach, a large set of industry recognized benchmarks has been compiled and analyzed to achieve the best code density in its class. In addition to lowering the memory requirements, a compact code size also contributes to the core's low power characteristics. The processor supports byte and halfword data types without penalty in code size and performance.

Memory load and store operations are provided for byte, halfword, word, and double word data with automatic sign- or zero extension of halfword and byte data. The C-compiler is closely linked to the architecture and is able to exploit code optimization features, both for size and speed.

In order to reduce code size to a minimum, some instructions have multiple addressing modes. As an example, instructions with immediates often have a compact format with a smaller immediate, and an extended format with a larger immediate. In this way, the compiler is able to use the format giving the smallest code size.

Another feature of the instruction set is that frequently used instructions, like add, have a compact format with two operands as well as an extended format with three operands. The larger format increases performance, allowing an addition and a data move in the same instruction in a single cycle. Load and store instructions have several different formats in order to reduce code size and speed up execution.

The register file is organized as sixteen 32-bit registers and includes the Program Counter, the Link Register, and the Stack Pointer. In addition, register R12 is designed to hold return values from function calls and is used implicitly by some instructions.

### 4.3 The AVR32UC CPU

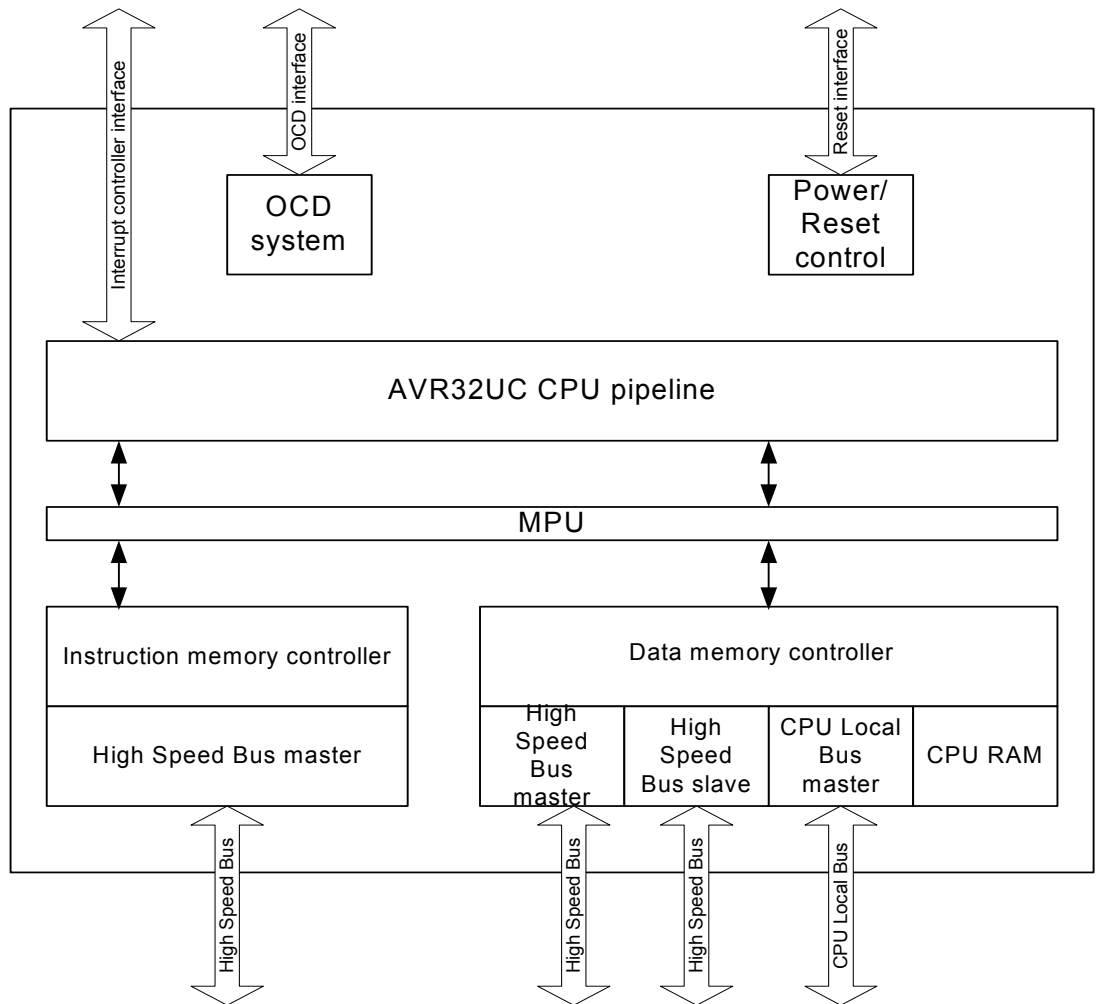

The AVR32UC CPU targets low- and medium-performance applications, and provides an advanced On-Chip Debug (OCD) system, no caches, and a Memory Protection Unit (MPU). Java acceleration hardware is not implemented.

AVR32UC provides three memory interfaces, one High Speed Bus master for instruction fetch, one High Speed Bus master for data access, and one High Speed Bus slave interface allowing other bus masters to access data RAMs internal to the CPU. Keeping data RAMs internal to the CPU allows fast access to the RAMs, reduces latency, and guarantees deterministic timing. Also, power consumption is reduced by not needing a full High Speed Bus access for memory accesses. A dedicated data RAM interface is provided for communicating with the internal data RAMs.

A local bus interface is provided for connecting the CPU to device-specific high-speed systems, such as floating-point units and I/O controller ports. This local bus has to be enabled by writing a one to the LOCEN bit in the CPUCR system register. The local bus is able to transfer data between the CPU and the local bus slave in a single clock cycle. The local bus has a dedicated memory range allocated to it, and data transfers are performed using regular load and store instructions. Details on which devices that are mapped into the local bus space is given in the CPU Local Bus section in the Memories chapter.

[Figure 4-1 on page 20](#) displays the contents of AVR32UC.

**Figure 4-1.** Overview of the AVR32UC CPU

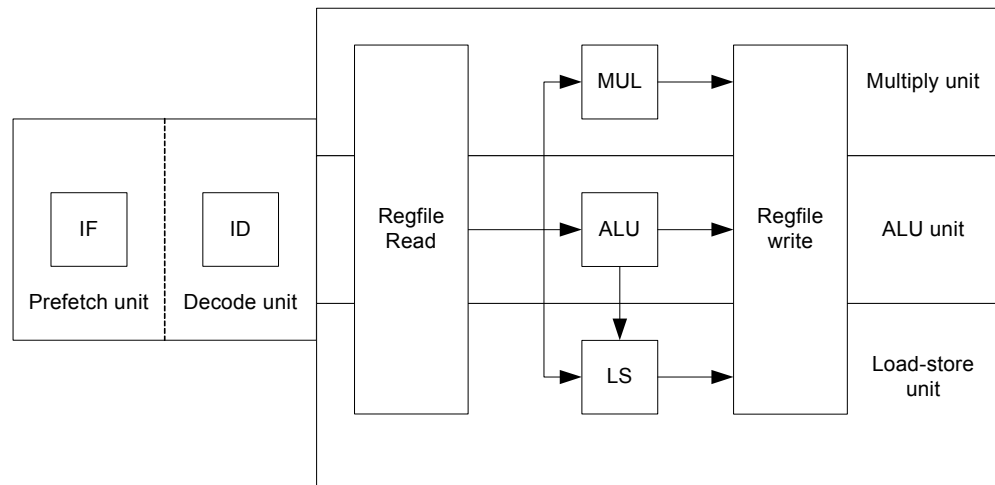

### 4.3.1 Pipeline Overview

AVR32UC has three pipeline stages, Instruction Fetch (IF), Instruction Decode (ID), and Instruction Execute (EX). The EX stage is split into three parallel subsections, one arithmetic/logic (ALU) section, one multiply (MUL) section, and one load/store (LS) section.

Instructions are issued and complete in order. Certain operations require several clock cycles to complete, and in this case, the instruction resides in the ID and EX stages for the required number of clock cycles. Since there is only three pipeline stages, no internal data forwarding is required, and no data dependencies can arise in the pipeline.

Figure 4-2 on page 21 shows an overview of the AVR32UC pipeline stages.

Figure 4-2. The AVR32UC Pipeline

### 4.3.2 AVR32A Microarchitecture Compliance

AVR32UC implements an AVR32A microarchitecture. The AVR32A microarchitecture is targeted at cost-sensitive, lower-end applications like smaller microcontrollers. This microarchitecture does not provide dedicated hardware registers for shadowing of register file registers in interrupt contexts. Additionally, it does not provide hardware registers for the return address registers and return status registers. Instead, all this information is stored on the system stack. This saves chip area at the expense of slower interrupt handling.

#### 4.3.2.1 Interrupt Handling

Upon interrupt initiation, registers R8-R12 are automatically pushed to the system stack. These registers are pushed regardless of the priority level of the pending interrupt. The return address and status register are also automatically pushed to stack. The interrupt handler can therefore use R8-R12 freely. Upon interrupt completion, the old R8-R12 registers and status register are restored, and execution continues at the return address stored popped from stack.

The stack is also used to store the status register and return address for exceptions and *scall*. Executing the *rete* or *rets* instruction at the completion of an exception or system call will pop this status register and continue execution at the popped return address.

#### 4.3.2.2 Java Support

AVR32UC does not provide Java hardware acceleration.

#### 4.3.2.3 Memory Protection

The MPU allows the user to check all memory accesses for privilege violations. If an access is attempted to an illegal memory address, the access is aborted and an exception is taken. The MPU in AVR32UC is specified in the AVR32UC Technical Reference manual.

#### 4.3.2.4 Unaligned Reference Handling

AVR32UC does not support unaligned accesses, except for doubleword accesses. AVR32UC is able to perform word-aligned *st.d* and *ld.d*. Any other unaligned memory access will cause an

address exception. Doubleword-sized accesses with word-aligned pointers will automatically be performed as two word-sized accesses.

The following table shows the instructions with support for unaligned addresses. All other instructions require aligned addresses.

**Table 4-1.** Instructions with Unaligned Reference Support

Instruction	Supported Alignment
ld.d	Word
st.d	Word

#### 4.3.2.5 *Unimplemented Instructions*

The following instructions are unimplemented in AVR32UC, and will cause an Unimplemented Instruction Exception if executed:

- All SIMD instructions
- All coprocessor instructions if no coprocessors are present
- retj, incjosp, popjc, pushjc
- tlbr, tlbs, tlbw
- cache

#### 4.3.2.6 *CPU and Architecture Revision*

Three major revisions of the AVR32UC CPU currently exist. The device described in this datasheet uses CPU revision 3.

The Architecture Revision field in the CONFIG0 system register identifies which architecture revision is implemented in a specific device.

AVR32UC CPU revision 3 is fully backward-compatible with revisions 1 and 2, ie. code compiled for revision 1 or 2 is binary-compatible with revision 3 CPUs.

## 4.4 Programming Model

### 4.4.1 Register File Configuration

The AVR32UC register file is shown below.

**Figure 4-3.** The AVR32UC Register File

Application	Supervisor	INT0	INT1	INT2	INT3	Exception	NMI	Secure	
Bit 31	Bit 0	Bit 31	Bit 0	Bit 31	Bit 0	Bit 31	Bit 0	Bit 31	Bit 0

SS_RSR

### 4.4.2 Status Register Configuration

The Status Register (SR) is split into two halfwords, one upper and one lower, see [Figure 4-4](#) and [Figure 4-5](#). The lower word contains the C, Z, N, V, and Q condition code flags and the R, T, and L bits, while the upper halfword contains information about the mode and state the processor executes in. Refer to the *AVR32 Architecture Manual* for details.

**Figure 4-4.** The Status Register High Halfword

**Figure 4-5.** The Status Register Low Halfword

### 4.4.3 Processor States

#### 4.4.3.1 Normal RISC State

The AVR32 processor supports several different execution contexts as shown in [Table 4-2](#).

**Table 4-2.** Overview of Execution Modes, their Priorities and Privilege Levels.

Priority	Mode	Security	Description
1	Non Maskable Interrupt	Privileged	Non Maskable high priority interrupt mode
2	Exception	Privileged	Execute exceptions
3	Interrupt 3	Privileged	General purpose interrupt mode
4	Interrupt 2	Privileged	General purpose interrupt mode
5	Interrupt 1	Privileged	General purpose interrupt mode
6	Interrupt 0	Privileged	General purpose interrupt mode
N/A	Supervisor	Privileged	Runs supervisor calls
N/A	Application	Unprivileged	Normal program execution mode

Mode changes can be made under software control, or can be caused by external interrupts or exception processing. A mode can be interrupted by a higher priority mode, but never by one with lower priority. Nested exceptions can be supported with a minimal software overhead.

When running an operating system on the AVR32, user processes will typically execute in the application mode. The programs executed in this mode are restricted from executing certain instructions. Furthermore, most system registers together with the upper halfword of the status register cannot be accessed. Protected memory areas are also not available. All other operating modes are privileged and are collectively called System Modes. They have full access to all privileged and unprivileged resources. After a reset, the processor will be in supervisor mode.

#### 4.4.3.2 Debug State

The AVR32 can be set in a debug state, which allows implementation of software monitor routines that can read out and alter system information for use during application development. This implies that all system and application registers, including the status registers and program counters, are accessible in debug state. The privileged instructions are also available.

All interrupt levels are by default disabled when debug state is entered, but they can individually be switched on by the monitor routine by clearing the respective mask bit in the status register.

Debug state can be entered as described in the *AVR32UC Technical Reference Manual*.

Debug state is exited by the *retd* instruction.

#### 4.4.3.3 Secure State

The AVR32 can be set in a secure state, that allows a part of the code to execute in a state with higher security levels. The rest of the code can not access resources reserved for this secure code. Secure State is used to implement FlashVault technology. Refer to the *AVR32UC Technical Reference Manual* for details.

#### 4.4.4 System Registers

The system registers are placed outside of the virtual memory space, and are only accessible using the privileged *mfsr* and *mtsr* instructions. The table below lists the system registers specified in the AVR32 architecture, some of which are unused in AVR32UC. The programmer is responsible for maintaining correct sequencing of any instructions following a *mtsr* instruction. For detail on the system registers, refer to the *AVR32UC Technical Reference Manual*.

**Table 4-3.** System Registers

Reg #	Address	Name	Function
0	0	SR	Status Register
1	4	EVBA	Exception Vector Base Address
2	8	ACBA	Application Call Base Address
3	12	CPUCR	CPU Control Register
4	16	ECR	Exception Cause Register
5	20	RSR_SUP	Unused in AVR32UC
6	24	RSR_INT0	Unused in AVR32UC
7	28	RSR_INT1	Unused in AVR32UC
8	32	RSR_INT2	Unused in AVR32UC
9	36	RSR_INT3	Unused in AVR32UC
10	40	RSR_EX	Unused in AVR32UC
11	44	RSR_NMI	Unused in AVR32UC
12	48	RSR_DBG	Return Status Register for Debug mode

## 4.5 Exceptions and Interrupts

In the AVR32 architecture, events are used as a common term for exceptions and interrupts. AVR32UC incorporates a powerful event handling scheme. The different event sources, like Illegal Op-code and interrupt requests, have different priority levels, ensuring a well-defined behavior when multiple events are received simultaneously. Additionally, pending events of a higher priority class may preempt handling of ongoing events of a lower priority class.

When an event occurs, the execution of the instruction stream is halted, and execution is passed to an event handler at an address specified in [Table 4-4 on page 31](#). Most of the handlers are placed sequentially in the code space starting at the address specified by EVBA, with four bytes between each handler. This gives ample space for a jump instruction to be placed there, jumping to the event routine itself. A few critical handlers have larger spacing between them, allowing the entire event routine to be placed directly at the address specified by the EVBA-relative offset generated by hardware. All interrupt sources have autovectored interrupt service routine (ISR) addresses. This allows the interrupt controller to directly specify the ISR address as an address

relative to EVBA. The autovector offset has 14 address bits, giving an offset of maximum 16384 bytes. The target address of the event handler is calculated as (EVBA | event\_handler\_offset), not (EVBA + event\_handler\_offset), so EVBA and exception code segments must be set up appropriately. The same mechanisms are used to service all different types of events, including interrupt requests, yielding a uniform event handling scheme.

An interrupt controller does the priority handling of the interrupts and provides the autovector offset to the CPU.

#### 4.5.1 System Stack Issues

Event handling in AVR32UC uses the system stack pointed to by the system stack pointer, SP\_SYS, for pushing and popping R8-R12, LR, status register, and return address. Since event code may be timing-critical, SP\_SYS should point to memory addresses in the IRAM section, since the timing of accesses to this memory section is both fast and deterministic.

The user must also make sure that the system stack is large enough so that any event is able to push the required registers to stack. If the system stack is full, and an event occurs, the system will enter an UNDEFINED state.

#### 4.5.2 Exceptions and Interrupt Requests

When an event other than *scall* or debug request is received by the core, the following actions are performed atomically:

1. The pending event will not be accepted if it is masked. The I3M, I2M, I1M, I0M, EM, and GM bits in the Status Register are used to mask different events. Not all events can be masked. A few critical events (NMI, Unrecoverable Exception, TLB Multiple Hit, and Bus Error) can not be masked. When an event is accepted, hardware automatically sets the mask bits corresponding to all sources with equal or lower priority. This inhibits acceptance of other events of the same or lower priority, except for the critical events listed above. Software may choose to clear some or all of these bits after saving the necessary state if other priority schemes are desired. It is the event source's responsibility to ensure that their events are left pending until accepted by the CPU.
2. When a request is accepted, the Status Register and Program Counter of the current context is stored to the system stack. If the event is an INT0, INT1, INT2, or INT3, registers R8-R12 and LR are also automatically stored to stack. Storing the Status Register ensures that the core is returned to the previous execution mode when the current event handling is completed. When exceptions occur, both the EM and GM bits are set, and the application may manually enable nested exceptions if desired by clearing the appropriate bit. Each exception handler has a dedicated handler address, and this address uniquely identifies the exception source.
3. The Mode bits are set to reflect the priority of the accepted event, and the correct register file bank is selected. The address of the event handler, as shown in [Table 4-4 on page 31](#), is loaded into the Program Counter.

The execution of the event handler routine then continues from the effective address calculated.

The *rete* instruction signals the end of the event. When encountered, the Return Status Register and Return Address Register are popped from the system stack and restored to the Status Register and Program Counter. If the *rete* instruction returns from INT0, INT1, INT2, or INT3, registers R8-R12 and LR are also popped from the system stack. The restored Status Register contains information allowing the core to resume operation in the previous execution mode. This concludes the event handling.

### 4.5.3 Supervisor Calls

The AVR32 instruction set provides a supervisor mode call instruction. The *scall* instruction is designed so that privileged routines can be called from any context. This facilitates sharing of code between different execution modes. The *scall* mechanism is designed so that a minimal execution cycle overhead is experienced when performing supervisor routine calls from time-critical event handlers.

The *scall* instruction behaves differently depending on which mode it is called from. The behaviour is detailed in the instruction set reference. In order to allow the *scall* routine to return to the correct context, a return from supervisor call instruction, *rets*, is implemented. In the AVR32UC CPU, *scall* and *rets* uses the system stack to store the return address and the status register.

### 4.5.4 Debug Requests

The AVR32 architecture defines a dedicated Debug mode. When a debug request is received by the core, Debug mode is entered. Entry into Debug mode can be masked by the DM bit in the status register. Upon entry into Debug mode, hardware sets the SR.D bit and jumps to the Debug Exception handler. By default, Debug mode executes in the exception context, but with dedicated Return Address Register and Return Status Register. These dedicated registers remove the need for storing this data to the system stack, thereby improving debuggability. The Mode bits in the Status Register can freely be manipulated in Debug mode, to observe registers in all contexts, while retaining full privileges.

Debug mode is exited by executing the *retd* instruction. This returns to the previous context.

### 4.5.5 Entry Points for Events

Several different event handler entry points exist. In AVR32UC, the reset address is 0x80000000. This places the reset address in the boot flash memory area.

TLB miss exceptions and *scall* have a dedicated space relative to EVBA where their event handler can be placed. This speeds up execution by removing the need for a jump instruction placed at the program address jumped to by the event hardware. All other exceptions have a dedicated event routine entry point located relative to EVBA. The handler routine address identifies the exception source directly.

AVR32UC uses the ITLB and DTLB protection exceptions to signal a MPU protection violation. ITLB and DTLB miss exceptions are used to signal that an access address did not map to any of the entries in the MPU. TLB multiple hit exception indicates that an access address did map to multiple TLB entries, signalling an error.

All interrupt requests have entry points located at an offset relative to EVBA. This autovector offset is specified by an interrupt controller. The programmer must make sure that none of the autovector offsets interfere with the placement of other code. The autovector offset has 14 address bits, giving an offset of maximum 16384 bytes.

Special considerations should be made when loading EVBA with a pointer. Due to security considerations, the event handlers should be located in non-writeable flash memory, or optionally in a privileged memory protection region if an MPU is present.

If several events occur on the same instruction, they are handled in a prioritized way. The priority ordering is presented in [Table 4-4 on page 31](#). If events occur on several instructions at different locations in the pipeline, the events on the oldest instruction are always handled before any events on any younger instruction, even if the younger instruction has events of higher priority

than the oldest instruction. An instruction B is younger than an instruction A if it was sent down the pipeline later than A.

The addresses and priority of simultaneous events are shown in [Table 4-4 on page 31](#). Some of the exceptions are unused in AVR32UC since it has no MMU, coprocessor interface, or floating-point unit.

**Table 4-4.** Priority and Handler Addresses for Events

Priority	Handler Address	Name	Event source	Stored Return Address
1	0x80000000	Reset	External input	Undefined
2	Provided by OCD system	OCD Stop CPU	OCD system	First non-completed instruction
3	EVBA+0x00	Unrecoverable exception	Internal	PC of offending instruction
4	EVBA+0x04	TLB multiple hit	MPU	PC of offending instruction
5	EVBA+0x08	Bus error data fetch	Data bus	First non-completed instruction
6	EVBA+0x0C	Bus error instruction fetch	Data bus	First non-completed instruction
7	EVBA+0x10	NMI	External input	First non-completed instruction
8	Autovectored	Interrupt 3 request	External input	First non-completed instruction
9	Autovectored	Interrupt 2 request	External input	First non-completed instruction
10	Autovectored	Interrupt 1 request	External input	First non-completed instruction
11	Autovectored	Interrupt 0 request	External input	First non-completed instruction
12	EVBA+0x14	Instruction Address	CPU	PC of offending instruction
13	EVBA+0x50	ITLB Miss	MPU	PC of offending instruction
14	EVBA+0x18	ITLB Protection	MPU	PC of offending instruction
15	EVBA+0x1C	Breakpoint	OCD system	First non-completed instruction
16	EVBA+0x20	Illegal Opcode	Instruction	PC of offending instruction
17	EVBA+0x24	Unimplemented instruction	Instruction	PC of offending instruction
18	EVBA+0x28	Privilege violation	Instruction	PC of offending instruction
19	EVBA+0x2C	Floating-point	UNUSED	
20	EVBA+0x30	Coprocessor absent	Instruction	PC of offending instruction
21	EVBA+0x100	Supervisor call	Instruction	PC(Supervisor Call) +2
22	EVBA+0x34	Data Address (Read)	CPU	PC of offending instruction
23	EVBA+0x38	Data Address (Write)	CPU	PC of offending instruction
24	EVBA+0x60	DTLB Miss (Read)	MPU	PC of offending instruction
25	EVBA+0x70	DTLB Miss (Write)	MPU	PC of offending instruction
26	EVBA+0x3C	DTLB Protection (Read)	MPU	PC of offending instruction
27	EVBA+0x40	DTLB Protection (Write)	MPU	PC of offending instruction
28	EVBA+0x44	DTLB Modified	UNUSED	

## 5. Memories

### 5.1 Embedded Memories

- Internal High-Speed Flash
  - 64Kbytes (AT32UC3L064)
  - 32Kbytes (AT32UC3L032)
  - 16Kbytes (AT32UC3L016)
    - 0 Wait State Access at up to 25MHz in Worst Case Conditions
    - 1 Wait State Access at up to 50MHz in Worst Case Conditions
    - Pipelined Flash Architecture, allowing burst reads from sequential Flash locations, hiding penalty of 1 wait state access
    - Pipelined Flash Architecture typically reduces the cycle penalty of 1 wait state operation to only 8% compared to 0 wait state operation
    - 100 000 Write Cycles, 15-year Data Retention Capability
    - Sector Lock Capabilities, Bootloader Protection, Security Bit
    - 32 Fuses, Erased During Chip Erase
    - User Page For Data To Be Preserved During Chip Erase
- Internal High-Speed SRAM, Single-cycle access at full speed
  - 16Kbytes (AT32UC3L064, AT32UC3L032)
  - 8Kbytes (AT32UC3L016)

### 5.2 Physical Memory Map

The system bus is implemented as a bus matrix. All system bus addresses are fixed, and they are never remapped in any way, not even in boot. Note that AVR32 UC CPU uses unsegmented translation, as described in the AVR32 Architecture Manual. The 32-bit physical address space is mapped as follows:

**Table 5-1.** AT32UC3L Physical Memory Map

Device	Start Address	Size		
		AT32UC3L064	AT32UC3L032	AT32UC3L016
Embedded SRAM	0x00000000	16Kbytes	16Kbytes	8Kbytes
Embedded Flash	0x80000000	64Kbytes	32Kbytes	16Kbytes
HSB-PB Bridge B	0xFFFFE0000	64Kbytes	64Kbytes	64Kbytes
HSB-PB Bridge A	0xFFFFF0000	64Kbytes	64Kbytes	64Kbytes

**Table 5-2.** Flash Memory Parameters

Part Number	Flash Size ( <i>FLASH_PW</i> )	Number of pages ( <i>FLASH_P</i> )	Page size ( <i>FLASH_W</i> )
AT32UC3L064	64Kbytes	256	256 bytes
AT32UC3L032	32Kbytes	128	256 bytes
AT32UC3L016	16Kbytes	64	256 bytes

## 5.3 Peripheral Address Map

**Table 5-3.** Peripheral Address Mapping

Address	Peripheral Name	Bus
0xFFFE0000	FLASHCDW Flash Controller - FLASHCDW	
0xFFFE0400	HMATRIX HSB Matrix - HMATRIX	
0xFFFE0800	SAU Secure Access Unit - SAU	
0xFFFF0000	PDCA Peripheral DMA Controller - PDCA	
0xFFFF1000	INTC Interrupt controller - INTC	
0xFFFF1400	PM Power Manager - PM	
0xFFFF1800	SCIF System Control Interface - SCIF	
0xFFFF1C00	AST Asynchronous Timer - AST	
0xFFFF2000	WDT Watchdog Timer - WDT	
0xFFFF2400	EIC External Interrupt Controller - EIC	
0xFFFF2800	FREQM Frequency Meter - FREQM	
0xFFFF2C00	GPIO General Purpose Input/Output Controller - GPIO	
0xFFFF3000	USART0 Universal Synchronous/Asynchronous Receiver/Transmitter - USART0	
0xFFFF3400	USART1 Universal Synchronous/Asynchronous Receiver/Transmitter - USART1	
0xFFFF3800	USART2 Universal Synchronous/Asynchronous Receiver/Transmitter - USART2	
0xFFFF3C00	USART3 Universal Synchronous/Asynchronous Receiver/Transmitter - USART3	
0xFFFF4000	SPI Serial Peripheral Interface - SPI	
0xFFFF4400	TWIM0 Two-wire Master Interface - TWIM0	

**Table 5-3.** Peripheral Address Mapping

0xFFFF4800	TWIM1	Two-wire Master Interface - TWIM1
0xFFFF4C00	TWIS0	Two-wire Slave Interface - TWIS0
0xFFFF5000	TWIS1	Two-wire Slave Interface - TWIS1
0xFFFF5400	PWMA	Pulse Width Modulation Controller - PWMA
0xFFFF5800	TC0	Timer/Counter - TC0
0xFFFF5C00	TC1	Timer/Counter - TC1
0xFFFF6000	ADCIFB	ADC Interface - ADCIFB
0xFFFF6400	ACIFB	Analog Comparator Interface - ACIFB
0xFFFF6800	CAT	Capacitive Touch Module - CAT
0xFFFF6C00	GLOC	Glue Logic Controller - GLOC
0xFFFF7000	AW	aWire - AW

## 5.4 CPU Local Bus Mapping

Some of the registers in the GPIO module are mapped onto the CPU local bus, in addition to being mapped on the Peripheral Bus. These registers can therefore be reached both by accesses on the Peripheral Bus, and by accesses on the local bus.

Mapping these registers on the local bus allows cycle-deterministic toggling of GPIO pins since the CPU and GPIO are the only modules connected to this bus. Also, since the local bus runs at CPU speed, one write or read operation can be performed per clock cycle to the local bus-mapped GPIO registers.

The following GPIO registers are mapped on the local bus:

**Table 5-4.** Local Bus Mapped GPIO Registers

Port	Register	Mode	Local Bus Address	Access
0	Output Driver Enable Register (ODER)	WRITE	0x40000040	Write-only
		SET	0x40000044	Write-only
		CLEAR	0x40000048	Write-only
		TOGGLE	0x4000004C	Write-only
	Output Value Register (OVR)	WRITE	0x40000050	Write-only
		SET	0x40000054	Write-only
		CLEAR	0x40000058	Write-only
		TOGGLE	0x4000005C	Write-only
	Pin Value Register (PVR)	-	0x40000060	Read-only
	1	Output Driver Enable Register (ODER)	WRITE	0x40000240
SET			0x40000244	Write-only
CLEAR			0x40000248	Write-only
TOGGLE			0x4000024C	Write-only
Output Value Register (OVR)		WRITE	0x40000250	Write-only
		SET	0x40000254	Write-only
		CLEAR	0x40000258	Write-only
		TOGGLE	0x4000025C	Write-only
Pin Value Register (PVR)		-	0x40000260	Read-only

## 6. Supply and Startup Considerations

### 6.1 Supply Considerations

#### 6.1.1 Power Supplies

The AT32UC3L has several types of power supply pins:

- VDDIO: Powers I/O lines. Voltage is 1.8 to 3.3V nominal.
- VDDIN: Powers I/O lines and the internal regulator. Voltage is 1.8 to 3.3V nominal.
- VDDANA: Powers the ADC. Voltage is 1.8V nominal.
- VDDCORE: Powers the core, memories, and peripherals. Voltage is 1.8V nominal.

The ground pins GND are common to VDDCORE and VDDIO. The ground pin for VDDANA is GNDANA.

Refer to [Section 7. on page 41](#) for power consumption on the various supply pins.

#### 6.1.2 Voltage Regulator

The AT32UC3L embeds a voltage regulator that converts from 3.3V nominal to 1.8V with a load of up to 60 mA. The regulator supplies the output voltage on VDDCORE. The regulator may only be used to drive internal circuitry in the device. VDDCORE should be externally connected to the 1.8V domains. See [Section 6.1.3](#) for regulator connection figures.

Adequate output supply decoupling is mandatory for VDDCORE to reduce ripple and avoid oscillations. The best way to achieve this is to use two capacitors in parallel between VDDCORE and GND as close to the chip as possible. Please refer to [Section 7.9.1 on page 50](#) for decoupling capacitors values and regulator characteristics.

**Figure 6-1.** Supply Decoupling

#### 6.1.3 Regulator Connection

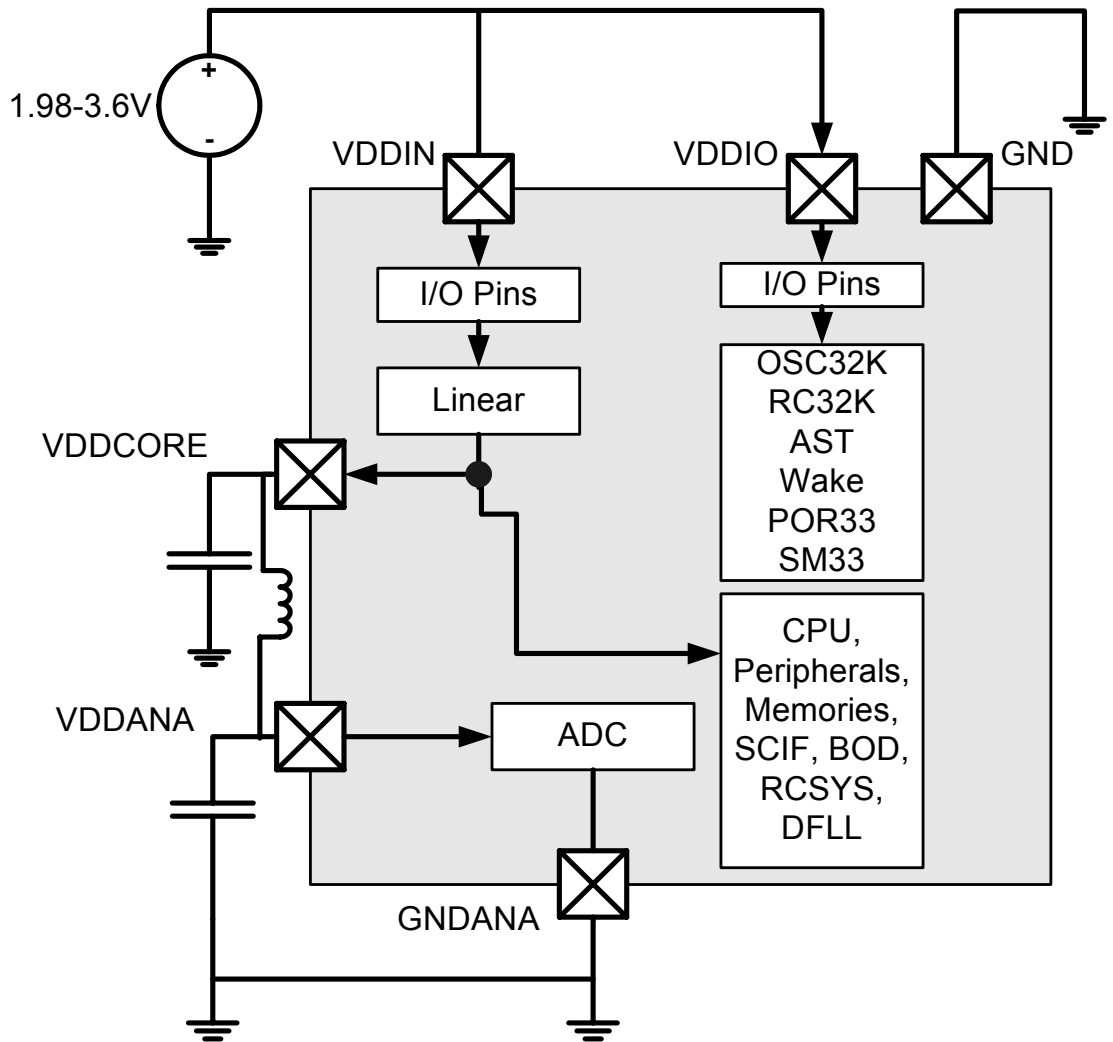

The AT32UC3L supports three power supply configurations:

- 3.3V single supply mode
- 1.8V single supply mode
- 3.3V supply mode, with 1.8V regulated I/O lines

## 6.1.3.1 3.3V Single Supply Mode

In 3.3V single supply mode the internal regulator is connected to the 3.3V source (VDDIN pin) and its output feeds VDDCORE. Figure 6-2 shows the power schematics to be used for 3.3V single supply mode. All I/O lines will be powered by the same power (VDDIN=VDDIO).

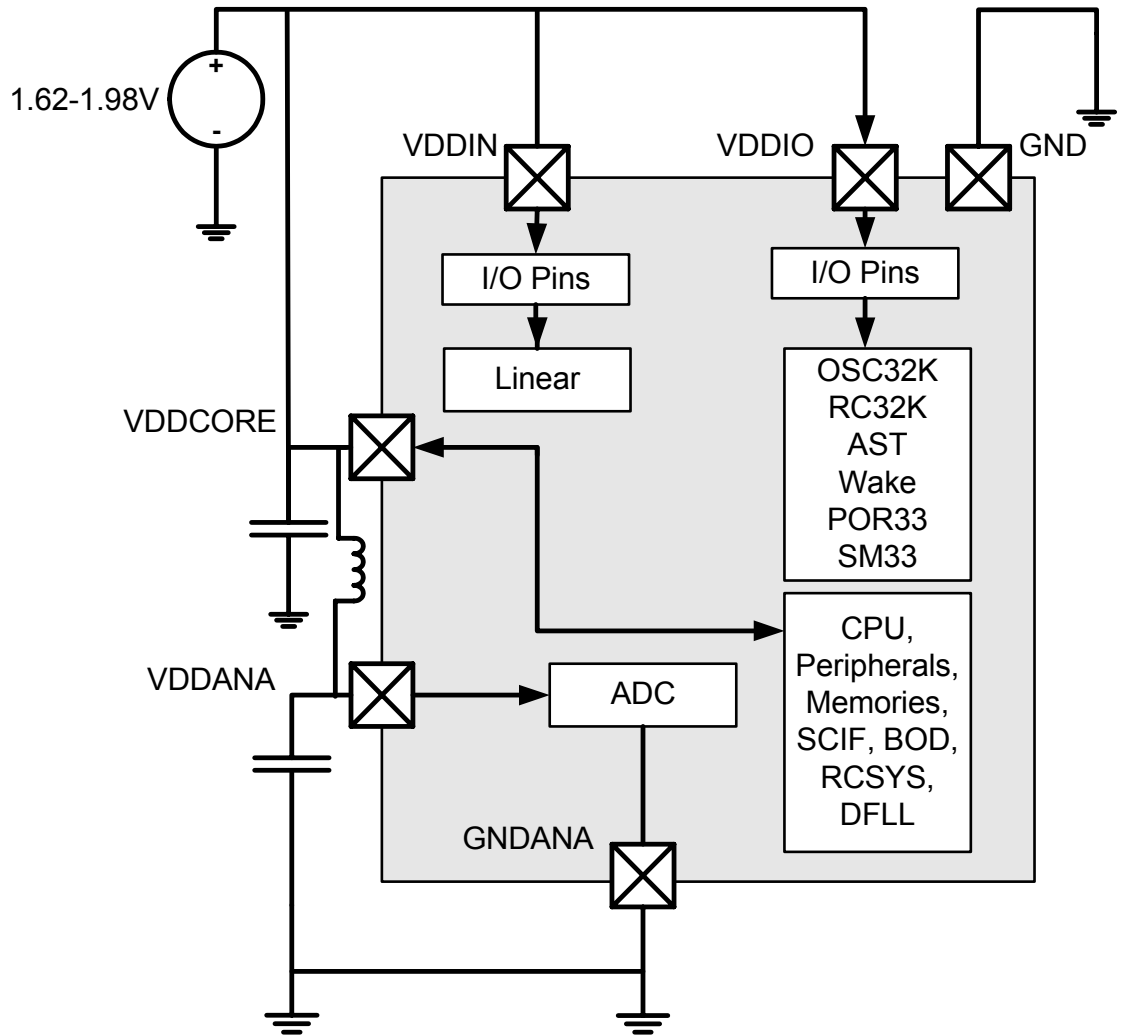

**Figure 6-2.** 3.3V Single Power Supply mode

## 6.1.3.2 1.8V Single Supply Mode

In 1.8V single supply mode the internal regulator is not used, and VDDIO and VDDCORE are powered by a single 1.8V supply as shown in Figure 6-3. All I/O lines will be powered by the same power (VDDIN = VDDIO = VDDCORE).

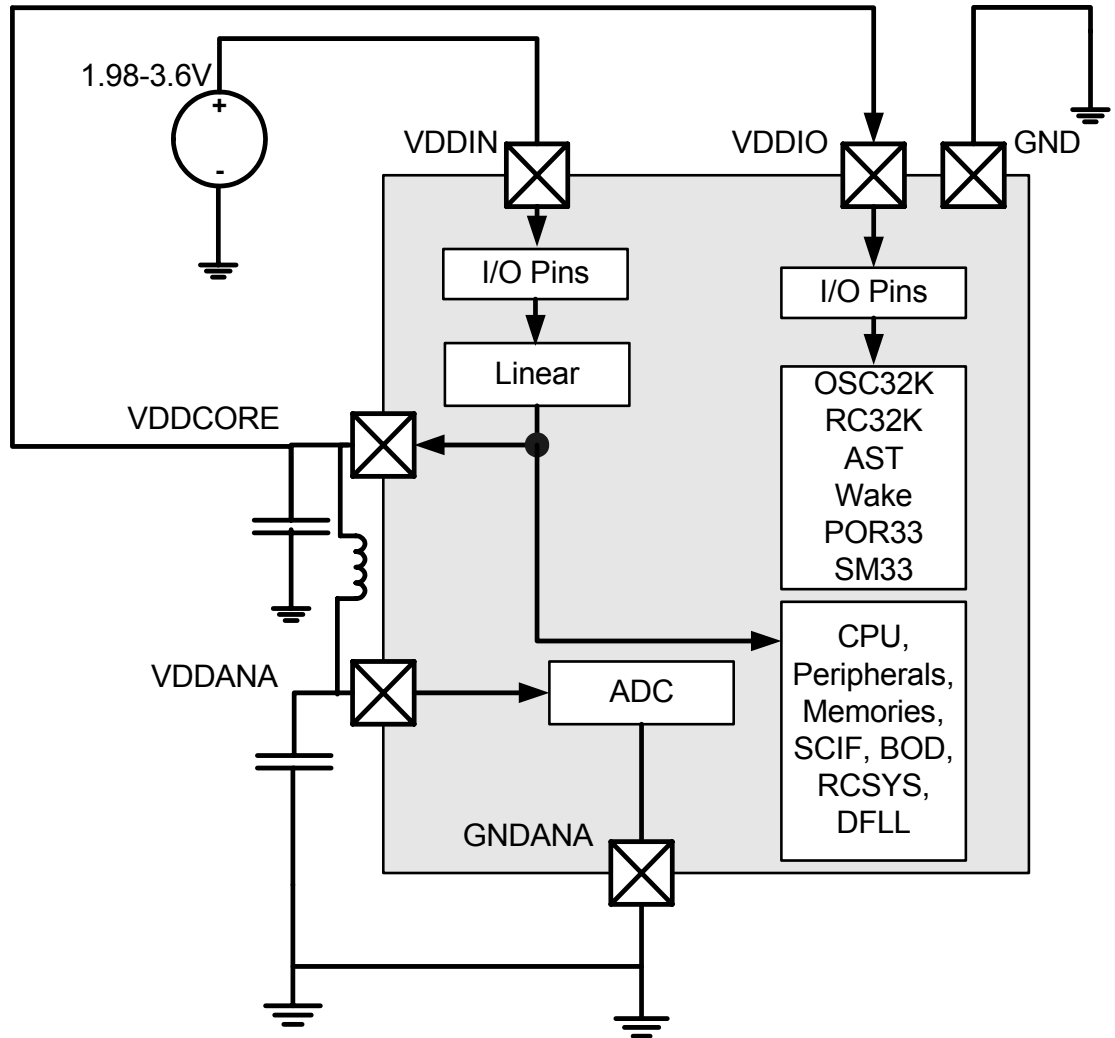

**Figure 6-3.** 1.8V Single Power Supply Mode.

## 6.1.3.3 3.3V Supply Mode with 1.8V Regulated I/O Lines

In this mode, the internal regulator is connected to the 3.3V source and its output is connected to both VDDCORE and VDDIO as shown in Figure 6-4. This configuration is required in order to use Shutdown mode.

**Figure 6-4.** 3.3V Power with 1.8V Regulated I/O Lines

In this mode, some I/O lines are powered by VDDIN while others I/O lines are powered by VDDIO. Refer to Section 3.2 on page 9 for description of power supply for each I/O line.

Refer to the Power Manager chapter for a description of what parts of the system are powered in Shutdown mode.

Important note: As the regulator has a maximum output current of 60mA, this mode can only be used in applications where the maximum I/O current is known and compatible with the core and peripheral power consumption. Typically, great care must be used to ensure that only a few I/O lines are toggling at the same time and drive very small loads.

## 6.1.4 Power-up Sequence

### 6.1.4.1 Maximum Rise Rate

To avoid risk of latch-up, the rise rate of the power supplies must not exceed the values described in [Table 7-3 on page 42](#).

Recommended order for power supplies is also described in this chapter.

### 6.1.4.2 Minimum Rise Rate

The integrated Power-Reset circuitry monitoring the VDDIN powering supply requires a minimum rise rate for the VDDIN power supply.

See [Table 7-3 on page 42](#) for the minimum rise rate value.

If the application can not ensure that the minimum rise rate condition for the VDDIN power supply is met, one of the following configuration can be used:

- A logic “0” value is applied during power-up on pin PA11 until VDDIN rises above 1.2V.
- A logic “0” value is applied during power-up on pin RESET\_N until VDDIN rises above 1.2V.

## 6.2 Startup Considerations

This chapter summarizes the boot sequence of the AT32UC3L. The behavior after power-up is controlled by the Power Manager. For specific details, refer to the Power Manager chapter.

### 6.2.1 Starting of Clocks

After power-up, the device will be held in a reset state by the Power-On Reset circuitry for a short time to allow the power to stabilize throughout the device. After reset, the device will use the System RC Oscillator (RCSYS) as clock source. Please refer to [Table 7-17 on page 49](#) for the frequency for this oscillator.

On system start-up, the DFLL is disabled. All clocks to all modules are running. No clocks have a divided frequency; all parts of the system receive a clock with the same frequency as the System RC Oscillator.

When powering up the device, there may be a delay before the voltage has stabilized, depending on the rise time of the supply used. The CPU can start executing code as soon as the supply is above the POR threshold, and before the supply is stable. Before switching to a high-speed clock source, the user should use the BOD to make sure the VDDCORE is above the minimum level (1.62V).

### 6.2.2 Fetching of Initial Instructions

After reset has been released, the AVR32 UC CPU starts fetching instructions from the reset address, which is 0x80000000. This address points to the first address in the internal Flash.

The code read from the internal Flash is free to configure the system to use for example the DFLL, to divide the frequency of the clock routed to some of the peripherals, and to gate the clocks to unused peripherals.

## 7. Electrical Characteristics

### 7.1 Disclaimer

All values in this chapter are preliminary and subject to change without further notice.

### 7.2 Absolute Maximum Ratings\*

**Table 7-1.** Absolute Maximum Ratings

Operating temperature.....	-40°C to +85°C
Storage temperature.....	-60°C to +150°C
Voltage on input pins (except for 5V pins) with respect to ground .....	-0.3V to $V_{VDD}^{(2)}$ +0.3V
Voltage on 5V tolerant <sup>(1)</sup> pins with respect to ground .....	-0.3V to 5.5V
Total DC output current on all I/O pins - VDDIO .....	120mA
Total DC output current on all I/O pins - VDDIN .....	36mA
Maximum operating voltage VDDCORE.....	1.98V
Maximum operating voltage VDDIO, VDDIN .....	3.6V

\*NOTICE: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

- Notes: 1. 5V tolerant pins, see [Section 3.2 "Peripheral Multiplexing on I/O lines" on page 9](#)  
 2.  $V_{VDD}$  corresponds to either  $V_{VDDIN}$  or  $V_{VDDIO}$ , depending on the supply for the pad. Refer to [Section 3.2 on page 9](#) for details.

### 7.3 Supply Characteristics

The following characteristics are applicable to the operating temperature range:  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ , unless otherwise specified and are certified for a junction temperature up to  $T_J = 100^\circ\text{C}$ .

**Table 7-2.** Supply Characteristics<sup>(1)</sup>

Symbol	Parameter	Voltage		
		Min	Max	Unit
$V_{VDDIO}$	DC supply peripheral I/Os	1.62	3.6	V
$V_{VDDIN}$	DC supply peripheral I/Os, 1.8V single supply mode	1.62	1.98	V
	DC supply peripheral I/Os and internal regulator, 3.3V single supply mode	1.98	3.6	V
$V_{VDDCORE}$	DC supply core	1.62	1.98	V
$V_{VDDANA}$	Analog supply voltage	1.62	1.98	V
$V_{ADVREFP}$	Analog reference voltage	1.62	$V_{VDDANA}$	V

Note: 1.  $V_{VDDANA} = V_{VDDCORE}$

**Table 7-3.** Supply Rise Rates and Order

Symbol	Parameter	Rise Rate			
		Min	Max	Unit	Comment
V <sub>VDDIO</sub>	DC supply peripheral I/Os	0	2.5	V/μs	
V <sub>VDDIN</sub>	DC supply peripheral I/Os and internal regulator	0.002 <sup>(1)</sup>	2.5	V/μs	
V <sub>VDDCORE</sub>	DC supply core	0	2.5	V/μs	Rise before or at the same time as VDDIO
V <sub>VDDANA</sub>	Analog supply voltage	0	2.5	V/μs	Rise together with VDDCORE

Note: 1. Slower rise time requires external power-on reset circuit.

## 7.4 Maximum Clock Frequencies

These parameters are given in the following conditions:

- V<sub>VDDCORE</sub> = 1.62 to 1.98V
- Temperature = -40°C to 85°C

**Table 7-4.** Clock Frequencies

Symbol	Parameter	Conditions	Min	Max	Units
f <sub>CPU</sub>	CPU clock frequency			50	MHz
f <sub>PBA</sub>	PBA clock frequency			50	MHz
f <sub>PBB</sub>	PBB clock frequency			50	MHz
f <sub>GCLK0</sub>	GCLK0 clock frequency			150	MHz
f <sub>GCLK1</sub>	GCLK1 clock frequency			150	MHz
f <sub>GCLK2</sub>	GCLK2 clock frequency			80	MHz
f <sub>GCLK3</sub>	GCLK3 clock frequency			110	MHz
f <sub>GCLK4</sub>	GCLK4 clock frequency			110	MHz
f <sub>GCLK5</sub>	GCLK5 clock frequency			80	MHz

## 7.5 Power Consumption

The values in [Table 7-5](#) are measured values of power consumption under the following conditions, except where noted:

- Operating conditions internal core supply ([Figure 7-1](#)) - this is the default configuration
  - V<sub>VDDIN</sub> = 3.0V
  - V<sub>VDDCORE</sub> = 1.62V
  - T<sub>A</sub> = 25°C
- Operating conditions external core supply ([Figure 7-2](#)) - used only when noted
  - V<sub>VDDIN</sub> = V<sub>VDDCORE</sub> = 1.8V
  - T<sub>A</sub> = 25°C
- Oscillators

- OSC0 (crystal oscillator) stopped
- OSC32K (32KHz crystal oscillator) running with external 32KHz crystal
- DFLL running at 50MHz with OSC32K as reference
- Clocks
  - DFLL used as main clock source
  - CPU, HSB, and PBB clocks undivided
  - PBA clock divided by 4
  - The following peripheral clocks running
    - PM, SCIF, AST, FLASHCDW, PBA bridge
  - All other peripheral clocks stopped
- I/Os are inactive with internal pull-up
- Flash enabled in high speed mode
- POR33 disabled

**Table 7-5.** Power Consumption for Different Modes

Mode	Conditions	Measured on	Consumption Typ	Unit
Active	-CPU running a recursive Fibonacci algorithm	Amp0	260	μA/MHz
	-CPU running a division algorithm		165	
Idle	92			
Frozen	58			
Standby	47			
Stop	37			
DeepStop	23		μA	
Static	-OSC32K and AST stopped -Internal core supply			10
	-OSC32K running -AST running at 1 KHz -External core supply (Figure 7-2)			5.3
	-OSC32K and AST stopped -External core supply (Figure 7-2)		4.7	
Shutdown	-OSC32K running -AST running at 1 KHz	600	nA	
	-AST and OSC32K stopped	9		

Figure 7-1. Measurement Schematic, Internal Core Supply

Figure 7-2. Measurement Schematic, External Core Supply

## 7.6 I/O Pad Characteristics

Table 7-6. Normal I/O Pad Characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Units
R <sub>PULLUP</sub>	Pull-up resistance		75	100	145	kOhm
V <sub>IL</sub>	Input low-level voltage	V <sub>VDD</sub> = 3.0V	-0.3		0.3*V <sub>VDD</sub>	V
		V <sub>VDD</sub> = 1.62V	-0.3		0.3*V <sub>VDD</sub>	
V <sub>IH</sub>	Input high-level voltage	V <sub>VDD</sub> = 3.6V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	V
		V <sub>VDD</sub> = 1.98V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	

**Table 7-6.** Normal I/O Pad Characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Units
V <sub>OL</sub>	Output low-level voltage	V <sub>VDD</sub> = 3.0V, I <sub>OL</sub> = 3mA			0.4	V
		V <sub>VDD</sub> = 1.62V, I <sub>OL</sub> = 2mA			0.4	
V <sub>OH</sub>	Output high-level voltage	V <sub>VDD</sub> = 3.0V, I <sub>OH</sub> = 3mA	V <sub>VDD</sub> - 0.4			V
		V <sub>VDD</sub> = 1.62V, I <sub>OH</sub> = 2mA	V <sub>VDD</sub> - 0.4			
I <sub>LEAK</sub>	Input leakage current	Pull-up resistors disabled			1	μA

Notes: 1. V<sub>VDD</sub> corresponds to either V<sub>VDDIN</sub> or V<sub>VDDIO</sub>, depending on the supply for the pad. Refer to [Section 3.2 on page 9](#) for details.

**Table 7-7.** High-drive I/O Pad Characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Units
R <sub>PULLUP</sub>	Pull-up resistance	PA06	30	50	110	kOhm
		PA02, PB01, RESET	75	100	145	
		PA08, PA09	10	20	45	
V <sub>IL</sub>	Input low-level voltage	V <sub>VDD</sub> = 3.0V	-0.3		0.3*V <sub>VDD</sub>	V
		V <sub>VDD</sub> = 1.62V	-0.3		0.3*V <sub>VDD</sub>	
V <sub>IH</sub>	Input high-level voltage	V <sub>VDD</sub> = 3.6V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	V
		V <sub>VDD</sub> = 1.98V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	
V <sub>OL</sub>	Output low-level voltage	V <sub>VDD</sub> = 3.0V, I <sub>OL</sub> = 6mA			0.4	V
		V <sub>VDD</sub> = 1.62V, I <sub>OL</sub> = 4mA			0.4	
V <sub>OH</sub>	Output high-level voltage	V <sub>VDD</sub> = 3.0V, I <sub>OH</sub> = 6mA	V <sub>VDD</sub> -0.4			V
		V <sub>VDD</sub> = 1.62V, I <sub>OH</sub> = 4mA	V <sub>VDD</sub> -0.4			
I <sub>LEAK</sub>	Input leakage current	Pull-up resistors disabled			1	μA

Notes: 1. V<sub>VDD</sub> corresponds to either V<sub>VDDIN</sub> or V<sub>VDDIO</sub>, depending on the supply for the pad. Refer to [Section 3.2 on page 9](#) for details.

**Table 7-8.** 5V Tolerant Normal I/O Pad Characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Units
R <sub>PULLUP</sub>	Pull-up resistance		75	100	145	kOhm
V <sub>IL</sub>	Input low-level voltage	V <sub>VDD</sub> = 3.0V	-0.3		0.3*V <sub>VDD</sub>	V

V <sub>OH</sub>	Output high-level voltage	V <sub>VDD</sub> = 3.0V, I <sub>OH</sub> = 6mA	V <sub>VDD</sub> -0.4			V
		V <sub>VDD</sub> = 1.62V, I <sub>OH</sub> = 4mA	V <sub>VDD</sub> -0.4			
I <sub>LEAK</sub>	Input leakage current	5.5V, pull-up resistors disabled			1	μA

Notes: 1. V<sub>VDD</sub> corresponds to either V<sub>VDDIN</sub> or V<sub>VDDIO</sub>, depending on the supply for the pad. Refer to [Section 3.2 on page 9](#) for details.

**Table 7-10.** TWI Pad Characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Units
R <sub>PULLUP</sub>	Pull-up resistance		25	35	50	kOhm
V <sub>IL</sub>	Input low-level voltage	V <sub>VDD</sub> = 3.0V	-0.3		0.3*V <sub>VDD</sub>	V
		V <sub>VDD</sub> = 1.62V	-0.3		0.3*V <sub>VDD</sub>	
V <sub>IH</sub>	Input high-level voltage	V <sub>VDD</sub> = 3.6V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	V
		V <sub>VDD</sub> = 1.98V	0.7*V <sub>VDD</sub>		V <sub>VDD</sub> + 0.3	
V <sub>OL</sub>	Output low-level voltage	I <sub>OL</sub> = 3mA			0.4	V
I <sub>LEAK</sub>	Input leakage current	Pull-up resistors disabled			1	μA
I <sub>IL</sub>	Input low leakage				1	μA
I <sub>IH</sub>	Input high leakage				1	μA
f <sub>MAX</sub>	Max frequency	Cbus = 400pF, V <sub>VDD</sub> > 2.0V	400			kHz

Notes: 1. V<sub>VDD</sub> corresponds to either V<sub>VDDIN</sub> or V<sub>VDDIO</sub>, depending on the supply for the pad. Refer to [Section 3.2 on page 9](#) for details.

## 7.7 Oscillator Characteristics

### 7.7.1 Oscillator 0 (OSC0) Characteristics

#### 7.7.1.1 Digital Clock Characteristics

The following table describes the characteristics for the oscillator when a digital clock is applied on XIN.

**Table 7-11.** Digital Clock Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Units
f <sub>CPXIN</sub>	XIN clock frequency				50	MHz
t <sub>CPXIN</sub>	XIN clock duty cycle		40		60	%

## 7.7.1.2 Crystal Oscillator Characteristics

The following table describes the characteristics for the oscillator when a crystal is connected between XIN and XOUT as shown in Figure 7-3. The user must choose a crystal oscillator where the crystal load capacitance  $C_L$  is within the range given in the table. The exact value of  $C_L$  can be found in the crystal datasheet. The capacitance of the external capacitors ( $C_{LEXT}$ ) can then be computed as follows:

$$C_{LEXT} = 2(C_L - C_i) - C_{PCB}$$

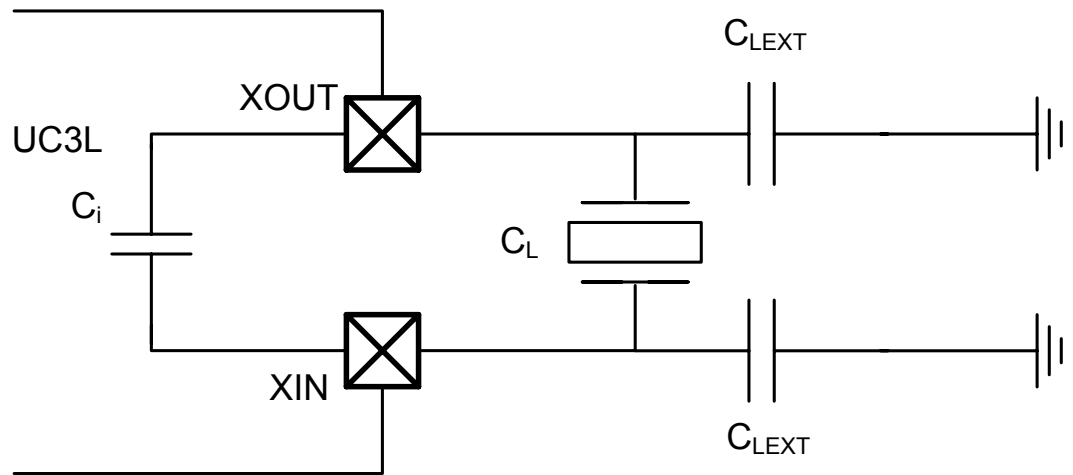

where  $C_{PCB}$  is the capacitance of the PCB.

**Table 7-12.** Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$1/(t_{CPMAIN})$	Crystal oscillator frequency		3		16	MHz
$C_L$	Crystal load capacitance		6		18	pF
$C_i$	Internal equivalent load capacitance			2		pF
$t_{STARTUP}$	Startup time	SCIF.OSCCTRL.GAIN = 2 <sup>(1)</sup>		30 000 <sup>(2)</sup>		cycles

- Notes: 1. Please refer to the SCIF chapter for details.  
2. Nominal crystal cycles.

**Figure 7-3.** Oscillator Connection

## 7.7.2 32KHz Crystal Oscillator (OSC32K) Characteristics

Figure 7-3 and the equation above also applies to the 32KHz oscillator connection. The user must choose a crystal oscillator where the crystal load capacitance  $C_L$  is within the range given in the table. The exact value of  $C_L$  can then be found in the crystal datasheet.

**Table 7-13.** 32 KHz Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$1/(t_{CP32KHz})$	Crystal oscillator frequency			32 768		Hz
$t_{ST}$	Startup time	$R_S = 60k\Omega, C_L = 9pF$		30 000 <sup>(1)</sup>		cycles
$C_L$	Crystal load capacitance		6		12.5	pF

**Table 7-13.** 32 KHz Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$C_i$	Internal equivalent load capacitance			2		pF
$I_{osc}$	Current consumption			0.9		$\mu$ A
$R_s$	Equivalent series resistance	32 768Hz	35		85	kOhm

Note: 1. Nominal crystal cycles.

### 7.7.3 Digital Frequency Locked Loop (DFLL) Characteristics

**Table 7-14.** Digital Frequency Locked Loop Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{OUT}$	Output frequency		40		150	MHz
$f_{REF}$	Reference frequency		8		150	kHz
	FINE resolution	FINE>100, all COARSE values		0.25		%
	Accuracy	Fine lock, $f_{REF}$ =32kHz, SSG disabled		0.1	0.5	%
		Accurate lock, $f_{REF}$ =32kHz, dither clk RCSYS/2, SG disabled		0.06	0.5	
		Fine lock, $f_{REF}$ =8-150kHz, SSG disabled		0.2	1	
		Accurate lock, $f_{REF}$ =8-150kHz, dither clk RCSYS/2, SSG disabled		0.1	1	
	Power consumption			22		$\mu$ A/MHz
$t_{STARTUP}$	Startup time	Within 90% of final values			100	$\mu$ s
$t_{LOCK}$	Lock time	$f_{REF}$ = 32kHz, fine lock, SSG disabled		600		$\mu$ s
		$f_{REF}$ = 32kHz, accurate lock, dithering clock = RCSYS/2, SSG disabled		1100		

Note: 1. Spread Spectrum Generator (SSG) is disabled by writing a zero to the EN bit in the SCIF.DFLL0SSG register.

## 7.7.4 120MHz RC Oscillator (RC120M) Characteristics

**Table 7-15.** Internal 120MHz RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OUT</sub>	Output frequency	T = 25°C, V <sub>VDDCORE</sub> = 1.8V	88	120	152	MHz
	Temperature drift			+/-5		%
Duty	Duty cycle		40	50	60	%

## 7.7.5 32kHz RC Oscillator (RC32K) Characteristics

**Table 7-16.** 32kHz RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OUT</sub>	Output frequency	T = 25°C, V <sub>VDDIO</sub> = 3.3V	20	32	44	kHz

## 7.7.6 System RC Oscillator (RCSYS) Characteristics

**Table 7-17.** System RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>OUT</sub>	Output frequency	Calibrated at 85°C		115		kHz

## 7.8 Flash Characteristics

Table 7-18 gives the device maximum operating frequency depending on the number of flash wait states and the flash read mode. The FSW bit in the FLASHCDW FSR register controls the number of wait states used when accessing the flash memory.

**Table 7-18.** Maximum Operating Frequency

Flash Wait States	Read Mode	Maximum Operating Frequency
1	High speed read mode	50MHz
0		25MHz
1	Normal read mode	30MHz
0		15MHz

**Table 7-19.** Flash Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T <sub>FPP</sub>	Page programming time	f <sub>CLK_HSB</sub> = 50MHz		5		ms
T <sub>FPE</sub>	Page erase time			5		
T <sub>FFP</sub>	Fuse programming time			1		
T <sub>FEA</sub>	Full chip erase time (EA)			5		
T <sub>FCE</sub>	JTAG chip erase time (CHIP_ERASE)	f <sub>CLK_HSB</sub> = 115kHz		300		

**Table 7-20.** Flash Endurance and Data Retention

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$N_{FARRAY}$	Array endurance (write/page)		100k			cycles
$N_{FFUSE}$	General Purpose fuses endurance (write/bit)		10k			cycles
$t_{RET}$	Data retention		15			years

## 7.9 Analog Characteristics

### 7.9.1 Voltage Regulator Characteristics

#### 7.9.1.1 Electrical Characteristics

**Table 7-21.** Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{VDDIN}$	Input voltage range		1.98	3.3	3.6	V
$V_{VDDCORE}$	Output voltage	$V_{VDDIN} > 1.98V$		1.8		V
	Output voltage accuracy	$I_{OUT} = 0.1mA \text{ to } 60mA,$ $V_{VDDIN} > 2.2V$		2		%
		$I_{OUT} = 0.1mA \text{ to } 60mA,$ $V_{VDDIN} = 1.98V \text{ to } 2.2V$		4		
$I_{OUT}$	DC output current	Normal mode			60	mA
		Low power mode			1	mA
$I_{SCR}$	Static current of internal regulator	Normal mode		20		$\mu A$
		Low power mode		6		$\mu A$

#### 7.9.1.2 Decoupling Requirements

**Table 7-22.** Decoupling Requirements

Symbol	Parameter	Condition	Typ	Techno.	Units
$C_{IN1}$	Input regulator capacitor 1		33		nF
$C_{IN2}$	Input regulator capacitor 2		100		nF
$C_{IN3}$	Input regulator capacitor 3		10		$\mu F$
$C_{OUT1}$	Output regulator capacitor 1		100		nF
$C_{OUT2}$	Output regulator capacitor 2		2.2	Tantalum 0.5<ESR<10	$\mu F$

Note: 1. Refer to [Section 6.1.2 on page 36](#).

## 7.9.2 ADC Characteristics

**Table 7-23.** Channel Conversion Time and ADC Clock

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$f_{ADC}$	ADC clock frequency	10-bit resolution mode			6	MHz
		8-bit resolution mode			6	
$t_{STARTUP}$	Startup time	Return from Idle Mode		15		$\mu$ s
	Sample and hold acquisition time		500			ns
$t_{CONV}$	Conversion time (latency)	$f_{ADC} = 6\text{MHz}$	11		26	cycles
	Throughput rate	$f_{ADC} = 6\text{MHz}$ , 10-bit resolution mode, low impedance source			460	kSPS
		$f_{ADC} = 6\text{MHz}$ , 8-bit resolution mode, low impedance source			460	

**Table 7-24.** External Voltage Reference Input

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$V_{ADVREFP}$	Reference voltage range	$V_{ADVREFP} = V_{VDDANA}$	1.62		1.98	V
	Current consumption on $V_{VDDANA}$	On 13 samples with ADC Clock = 5MHz				mA
$I_{ADVREFP}$	Average current	$f_{ADC} = 6\text{MHz}$			250	$\mu$ A

**Table 7-25.** Analog Inputs

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$V_{ADn}$	Input Voltage Range	10-bit mode	0		$V_{ADVREFP}$	V
		8-bit mode				

### 7.9.2.1 Applicable Conditions and Derating Data

**Table 7-26.** Transfer Characteristics 10-bit Resolution Mode

Parameter	Conditions	Min	Typ	Max	Units
Resolution			10		Bit
Integral non-linearity	ADC clock frequency = 6MHz		+/-2		LSB
Differential non-linearity		-0.9		1	
Offset error			+/-4		
Gain error			+/-4		

**Table 7-27.** Transfer Characteristics 8-bit Resolution Mode

Parameter	Conditions	Min	Typ	Max	Units
Resolution			8		Bit

**Table 7-27.** Transfer Characteristics 8-bit Resolution Mode

Parameter	Conditions	Min	Typ	Max	Units
Integral non-linearity	ADC clock frequency = 6MHz		+/-0.5		LSB
Differential non-linearity		-0.23		0.25	
Offset error			+/-1		
Gain error			+/-1		

### 7.9.3 Analog Comparator Characteristics

**Table 7-28.** Analog Comparator Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Units
	Positive input voltage range		-0.2		$V_{VDDIO} + 0.3$	V
	Negative input voltage range		-0.2		$V_{VDDIO} - 0.6$	V
	Statistical offset	$V_{ACREFN} = 1.0V, f_{AC} = 12MHz,$ filter length=2, hysteresis=0. <sup>(1)</sup>		20		mV
$f_{AC}$	Clock frequency for GCLK4				12	MHz
$t_{STARTUP}$	Startup time		3			cycles
	Input current per pin			0.2		$\mu A/MHz$ <sup>(2)</sup>

Notes: 1. AC.CONFn.FLEN and AC.CONFn.HYS fields, refer to the Analog Comparator Interface chapter.  
 2. Referring to  $f_{AC}$ .

7.9.4 POR18

Table 7-29. Power-on Reset Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{POT+}$	Voltage threshold on $V_{VDDCORE}$ rising	$T=25^{\circ}C$		1.45		V
$V_{POT-}$	Voltage threshold on $V_{VDDCORE}$ falling	$T=25^{\circ}C$		1.32		V

Figure 7-4. POR18 Operating Principles

7.9.5 POR33

Table 7-30. POR33 Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{POT+}$	Voltage threshold on $V_{DDIN}$ rising	$T=25^{\circ}C$		1.49		V
$V_{POT-}$	Voltage threshold on $V_{DDIN}$ falling			1.45		

Figure 7-5. POR33 Operating Principles

7.9.6 Temperature Sensor

7.10 Timing Characteristics

7.10.1 RESET\_N Characteristics

Table 7-32. RESET\_N Waveform Parameters

Symbol	Parameter	Conditions	Min	Max	Units
$t_{RESET}$	RESET_N minimum pulse length		10		ns

## 8. Mechanical Characteristics

### 8.1 Thermal Considerations

#### 8.1.1 Thermal Data

Table 8-1 summarizes the thermal resistance data depending on the package.

**Table 8-1.** Thermal Resistance Data

Symbol	Parameter	Condition	Package	Typ	Unit
$\theta_{JA}$	Junction-to-ambient thermal resistance	Still Air	TQFP48	63.2	°C/W
$\theta_{JC}$	Junction-to-case thermal resistance		TQFP48	21.8	
$\theta_{JA}$	Junction-to-ambient thermal resistance	Still Air	QFN48	28.3	°C/W
$\theta_{JC}$	Junction-to-case thermal resistance		QFN48	2.5	
$\theta_{JA}$	Junction-to-ambient thermal resistance	Still Air	TLLGA48	30.06	°C/W
$\theta_{JC}$	Junction-to-case thermal resistance		TLLGA48	TBD	

#### 8.1.2 Junction Temperature

The average chip-junction temperature,  $T_J$ , in °C can be obtained from the following:

1.  $T_J = T_A + (P_D \times \theta_{JA})$
2.  $T_J = T_A + (P_D \times (\theta_{HEATSINK} + \theta_{JC}))$

where:

- $\theta_{JA}$  = package thermal resistance, Junction-to-ambient (°C/W), provided in [Table 8-1](#).
- $\theta_{JC}$  = package thermal resistance, Junction-to-case thermal resistance (°C/W), provided in [Table 8-1](#).
- $\theta_{HEAT\ SINK}$  = cooling device thermal resistance (°C/W), provided in the device datasheet.
- $P_D$  = device power consumption (W) estimated from data provided in the [Section 7.5 on page 42](#).
- $T_A$  = ambient temperature (°C).

From the first equation, the user can derive the estimated lifetime of the chip and decide if a cooling device is necessary or not. If a cooling device is to be fitted on the chip, the second equation should be used to compute the resulting average chip-junction temperature  $T_J$  in °C.

8.2 Package Drawings

### 8.3 Soldering Profile

Table 8-11 gives the recommended soldering profile from J-STD-20.

**Table 8-11.** Soldering Profile

Profile Feature	Green Package
Average Ramp-up Rate (217°C to Peak)	3°C/s max
Preheat Temperature 175°C ±25°C	150-200°C
Time Maintained Above 217°C	60-150 s
Time within 5°C of Actual Peak Temperature	30 s
Peak Temperature Range	260°C
Ramp-down Rate	6°C/s max
Time 25°C to Peak Temperature	8 minutes max

A maximum of three reflow passes is allowed per component.

## 9. Ordering Information

**Table 9-1.** Ordering Information

Device	Ordering Code	Carrier Type	Package	Package Type	Temperature Operating Range

## 10. Errata

### 10.1 Rev. E

#### 10.1.1 Processor and Architecture

**1. Privilege violation when using interrupts in application mode with protected system stack**

If the system stack is protected by the MPU and an interrupt occurs in application mode, an MPU DTLB exception will occur.

**Fix/Workaround**

Make a DTLB Protection (Write) exception handler which permits the interrupt request to be handled in privileged mode.

**2. Hardware breakpoints may corrupt MAC results**

Hardware breakpoints on MAC instructions may corrupt the destination register of the MAC instruction.

**Fix/Workaround**

Place breakpoints on earlier or later instructions.

#### 10.1.2 FLASHCDW

**1. Flash Selfprogramming may fail in one wait state mode**

Writes in flash and user pages may fail if executing code located in the address space mapped to the flash and if the flash controller is configured in one wait state mode (the Flash Wait State bit in the Flash Control Register (FCR.FWS) is 1).

**Fix/Workaround**

Solution 1: Configure the flash controller in zero wait state mode (FCR.FWS=0).

Solution 2: Configure the HMATRIX master 1 (CPU Instruction) to use the unlimited burst length transfer mode (MCFG1.ULBT=0) and the HMATRIX slave 0 (FLASHCDW) to use the maximum slot cycle limit (SCFG0.SLOT\_CYCLE=255).

#### 10.1.3 Power Manager

**1. Clock sources will not be stopped in Static mode if the difference between CPU and PBx division factor is larger than 4**

If the division factor between the CPU/HSB and PBx frequencies is more than 4 when entering a sleep mode where the system RC oscillator (RCSYS) is turned off, the high speed clock sources will not be turned off. This will result in a significantly higher power consumption during the sleep mode.

**Fix/Workaround**

Before going to sleep modes where RCSYS is stopped, make sure the division factor between the CPU/HSB and PBx frequencies is less than or equal to 4.

**2. Clock Failure Detector (CFD) can be issued while turning off the CFD**

While turning off the CFD, the CFD bit in the Status Register (SR) can be set. This will change the main clock source to RCSYS.

**Fix/Workaround**

Solution 1: Enable CFD interrupt. If CFD interrupt is issues after turning off the CFD, switch back to original main clock source.

Solution 2: Only turn off the CFD while running the main clock on RCSYS.

## 10.1.4 SCIF

- PCLKSR.OSC32RDY bit might not be cleared after disabling OSC32K**  
 In some cases the OSC32RDY bit in the PCLKSR register will not be cleared when OSC32K is disabled.  
**Fix/Workaround**  
 When re-enabling the OSC32K, read the PCLKSR.OSC32RDY bit. If this bit is:  
 0: Follow normal procedures.  
 1: Ignore the PCLKSR.OSC32RDY and ISR.OSC32RDY bit. Use the Frequency Meter (FREQM) to determine if the OSC32K clock is ready. The OSC32K clock is ready when the FREQM measures a non-zero frequency.

## 10.1.5 AST

- Reset may set status bits in the AST**  
 If a reset occurs and the AST is enabled, the SR.ALARM0, SR.PER0, and SR.OVF bits may be set.  
**Fix/Workaround**  
 If the part is reset and the AST is used, clear all bits in the Status Register (SR) before entering sleep mode.
- AST wake signal is released one AST clock cycle after the BUSY bit is cleared**  
 After writing to the Status Clear Register (SCR) the wake signal is released one AST clock cycle after the BUSY bit in the Status Register (SR.BUSY) is cleared. If entering sleep mode directly after the BUSY bit is cleared the part will wake up immediately.  
**Fix/Workaround**  
 Read the Wake Enable Register (WER) and write this value back to the same register. Wait for BUSY to clear before entering sleep mode.

## 10.1.6 WDT

- Clearing the Watchdog Timer (WDT) counter in second half of timeout period will issue a Watchdog reset**  
 If the WDT counter is cleared in the second half of the timeout period, the WDT will immediately issue a Watchdog reset.  
**Fix/Workaround**  
 Use twice as long timeout period as needed and clear the WDT counter within the first half of the timeout period. If the the WDT counter is cleared after the first half of the timeout period, you will get a Watchdog reset immediately. If the WDT counter is not cleared at all, the time before the reset will be twice as long as needed.

## 10.1.7 GPIO

- Clearing GPIO interrupt may fail**  
 Writing a one to the GPIO.IFRC register to clear the interrupt will be ignored if interrupt is enabled for the corresponding port.  
**Fix / Workaround**  
 Disable the interrupt, clear the interrupt by writing a one to GPIO.IFRC, then enable the interrupt.

## 10.1.8 SPI

1. **SPI disable does not work in SLAVE mode**

SPI disable does not work in SLAVE mode.

**Fix/Workaround**

Read the last received data, then perform a software reset by writing a one to the Software Reset bit in the Control Register (CR.SWRST).

2. **SPI Bad Serial Clock Generation on 2nd chip select when SCBR==1, CPOL==1, and NCPHA==0**

When multiple chip selects are in use, if one of the baudrates is equal to 1 (CSRn.SCBR==1) and one of the others is not equal to 1, and CSRn.CPOL==1 and CSRn.NCPHA==0, an additional pulse will be generated on SCK.

**Fix/Workaround**

When multiple chip selects are in use, if one of the baudrates is equal to 1, the others must also be equal to 1 if CSRn.CPOL==1 and CSRn.NCPHA==0.

3. **SPI data transfer hangs with CSR0.CSAAT==1 and MR.MODFDIS==0**

When CSR0.CSAAT==1 and mode fault detection is enabled (MR.MODFDIS==0), the SPI module will not start a data transfer.

**Fix/Workaround**

Disable mode fault detection by writing a one to MR.MODFDIS.

4. **Disabling SPI has no effect on the SR.TDRE bit**

Disabling SPI has no effect on SR.TDRE whereas the write data command is filtered when SPI is disabled. This means that as soon as the SPI is disabled it becomes impossible to reset the SR.TDRE bit by writing to TDR. So if the SPI is disabled during a PDCA transfer, the PDCA will continue to write data to TDR (as SR.TDRE stays high) until its buffer is empty, and all data written after the disable command is lost.

**Fix/Workaround**

Disable the PDCA, add 2 NOP (minimum), and disable the SPI. To continue the transfer, enable the SPI and the PDCA.

5. **SPI mode fault detection enable causes incorrect behavior**

When mode fault detection is enabled (MR.MODFDIS==0), the SPI module may not operate properly.

**Fix/Workaround**

Always disable mode fault detection before using the SPI by writing a one to MR.MODFDIS.

## 10.1.9 TWI

1. **TWIM.SR.IDLE goes high immediately when NAK is received**

When a NAK is received and there is a non-zero number of bytes to be transmitted, SR.IDLE goes high immediately and does not wait for the STOP condition to be sent. This does not cause any problem just by itself, but can cause a problem if software waits for SR.IDLE to go high and then immediately disables the TWIM by writing a one to CR.MDIS. Disabling the TWIM causes the TWCK and TWD pins to go high immediately, so the STOP condition will not be transmitted correctly.

**Fix/Workaround**

If possible, do not disable the TWIM. If it is absolutely necessary to disable the TWIM, there must be a software delay of at least two TWCK periods between the detection of SR.IDLE==1 and the disabling of the TWIM.

### 10.1.10 PWMA

**1. BUSY bit is never cleared after writes to the Control Register (CR)**

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR when the PWMA is disabled (CR.EN==0), the BUSY bit in the Status Register (SR.BUSY) will be set, but never cleared.

**Fix/Workaround**

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR, make sure the PWMA is enabled, or simultaneously enable the PWMA by writing a one to CR.EN.

**2. Incoming peripheral events are discarded during duty cycle register update**

Incoming peripheral events to all applied channels will be discarded if a duty cycle update is received from the user interface in the same PWMA clock period.

**Fix/Workaround**

Ensure that duty cycle writes from the user interface are not performed in a PWMA clock period when an incoming peripheral event is expected.

### 10.1.11 CAT

**1. CAT asynchronous wake will be delayed by one AST peripheral event period**

If the CAT detects a condition that should asynchronously wake the chip in Static mode, the asynchronous wake will not occur until the next AST event. For example, if the AST is generating peripheral events to the CAT every 50 milliseconds, and the CAT detects a touch at t=9200 milliseconds, the asynchronous wake will occur at t=9250 milliseconds.

**Fix/Workaround**

None.

### 10.1.12 aWire

**1. aWire CPU clock speed robustness**

The aWire memory speed request command counter wraps at clock speeds below approximately 5kHz.

**Fix/Workaround**

None.

**2. The aWire debug interface is reset after leaving Shutdown mode**

If the aWire debug mode is used as debug interface and the program enters Shutdown mode, the aWire interface will be reset when the device receives a wake-up either from the WAKE\_N pin or the AST.

**Fix/Workaround**

None.

### 10.1.13 I/O Pins

**1. PA17 has low ESD tolerance**

PA17 only tolerates 500V ESD pulses (Human Body Model).

**Fix/Workaround**

Care must be taken during manufacturing and PCB design.

## 10.2 Rev. D

### 10.2.1 Processor and Architecture

1. **Privilege violation when using interrupts in application mode with protected system stack**  
 If the system stack is protected by the MPU and an interrupt occurs in application mode, an MPU DTLB exception will occur.  
**Fix/Workaround**  
 Make a DTLB Protection (Write) exception handler which permits the interrupt request to be handled in privileged mode.
2. **Hardware breakpoints may corrupt MAC results**  
 Hardware breakpoints on MAC instructions may corrupt the destination register of the MAC instruction.  
**Fix/Workaround**  
 Place breakpoints on earlier or later instructions.

### 10.2.2 FLASHCDW

1. **Flash Selfprogramming may fail in one wait state mode**  
 Writes in flash and user pages may fail if executing code located in the address space mapped to the flash and if the flash controller is configured in one wait state mode (the Flash Wait State bit in the Flash Control Register (FCR.FWS) is 1).  
**Fix/Workaround**  
 Solution 1: Configure the flash controller in zero wait state mode (FCR.FWS=0).  
 Solution 2: Configure the HMATRIX master 1 (CPU Instruction) to use the unlimited burst length transfer mode (MCFG1.ULBT=0) and the HMATRIX slave 0 (FLASHCDW) to use the maximum slot cycle limit (SCFG0.SLOT\_CYCLE=255).

### 10.2.3 Power Manager

1. **Clock sources will not be stopped in Static mode if the difference between CPU and PBx division factor is larger than 4**  
 If the division factor between the CPU/HSB and PBx frequencies is more than 4 when entering a sleep mode where the system RC oscillator (RCSYS) is turned off, the high speed clock sources will not be turned off. This will result in a significantly higher power consumption during the sleep mode.  
**Fix/Workaround**  
 Before going to sleep modes where RCSYS is stopped, make sure the division factor between the CPU/HSB and PBx frequencies is less than or equal to 4.
2. **External reset in Shutdown mode**  
 If an external reset is asserted while the chip is in Shutdown mode, the Power Manager will register this as a Power-on reset (POR), and not as a SLEEP reset, in the Reset Cause register (RCAUSE).  
**Fix/Workaround**  
 None.
3. **Disabling POR33 may generate spurious resets**  
 Depending on operating conditions, POR33 may generate a spurious reset in one of the following cases:
  - When POR33 is disabled from the user interface.
  - When SM33 supply monitor is enabled.

- When entering Shutdown mode while debugging the chip using JTAG or aWire interface. In the listed cases, writing a one to the bit VREGCR.POR33MASK in the System Control Interface (SCIF) to mask the POR33 reset will be ineffective.

**Fix/Workaround**

- Do not disable POR33 using the user interface.
- Do not use the SM33 supply monitor.
- Do not enter Shutdown mode if a debugger is connected to the chip.

**4. Instability when exiting sleep walking**

If all the following operating conditions are true, exiting sleep walking might lead to instability:

- The OSC0 is enabled in external clock mode (OSCCTRL0.OSCEN == 1 and OSCCTRL0.MODE == 0)
- A sleep mode where the OSC0 is automatically disabled is entered
- The chip enters sleep walking

**Fix/Workaround**

Do not run OSC0 in external clock mode if sleep walking is expected to be used.

**5. Clock Failure Detector (CFD) can be issued while turning off the CFD**

While turning off the CFD, the CFD bit in the Status Register (SR) can be set. This will change the main clock source to RCSYS.

**Fix/Workaround**

Solution 1: Enable CFD interrupt. If CFD interrupt is issues after turning off the CFD, switch back to original main clock source.

Solution 2: Only turn off the CFD while running the main clock on RCSYS.

**10.2.4 SCIF**

**1. PCLKSR.OSC32RDY bit might not be cleared after disabling OSC32K**

In some cases the OSC32RDY bit in the PCLKSR register will not be cleared when OSC32K is disabled.

**Fix/Workaround**

When re-enabling the OSC32K, read the PCLKSR.OSC32RDY bit. If this bit is:

0: Follow normal procedures.

1: Ignore the PCLKSR.OSC32RDY and ISR.OSC32RDY bit. Use the Frequency Meter (FREQM) to determine if the OSC32K clock is ready. The OSC32K clock is ready when the FREQM measures a non-zero frequency.

**10.2.5 AST**

**1. Reset may set status bits in the AST**

If a reset occurs and the AST is enabled, the SR.ALARM0, SR.PER0, and SR.OVF bits may be set.

**Fix/Workaround**

If the part is reset and the AST is used, clear all bits in the Status Register (SR) before entering sleep mode.

**2. AST wake signal is released one AST clock cycle after the BUSY bit is cleared**

After writing to the Status Clear Register (SCR) the wake signal is released one AST clock cycle after the BUSY bit in the Status Register (SR.BUSY) is cleared. If entering sleep mode directly after the BUSY bit is cleared the part will wake up immediately.

**Fix/Workaround**

Read the Wake Enable Register (WER) and write this value back to the same register. Wait for BUSY to clear before entering sleep mode.

## 10.2.6 WDT

1. **Clearing the Watchdog Timer (WDT) counter in second half of timeout period will issue a Watchdog reset**

If the WDT counter is cleared in the second half of the timeout period, the WDT will immediately issue a Watchdog reset.

**Fix/Workaround**

Use twice as long timeout period as needed and clear the WDT counter within the first half of the timeout period. If the WDT counter is cleared after the first half of the timeout period, you will get a Watchdog reset immediately. If the WDT counter is not cleared at all, the time before the reset will be twice as long as needed.

## 10.2.7 GPIO

1. **Clearing GPIO interrupt may fail**

Writing a one to the GPIO.IFRC register to clear the interrupt will be ignored if interrupt is enabled for the corresponding port.

**Fix / Workaround**

Disable the interrupt, clear the interrupt by writing a one to GPIO.IFRC, then enable the interrupt.

## 10.2.8 SPI

1. **SPI disable does not work in SLAVE mode**

SPI disable does not work in SLAVE mode.

**Fix/Workaround**

Read the last received data, then perform a software reset by writing a one to the Software Reset bit in the Control Register (CR.SWRST).

2. **SPI Bad Serial Clock Generation on 2nd chip select when SCBR==1, CPOL==1, and NCPHA==0**

When multiple chip selects are in use, if one of the baudrates is equal to 1 (CSRn.SCBR==1) and one of the others is not equal to 1, and CSRn.CPOL==1 and CSRn.NCPHA==0, an additional pulse will be generated on SCK.

**Fix/Workaround**

When multiple chip selects are in use, if one of the baudrates is equal to 1, the others must also be equal to 1 if CSRn.CPOL==1 and CSRn.NCPHA==0.

3. **SPI data transfer hangs with CSR0.CSAAT==1 and MR.MODFDIS==0**

When CSR0.CSAAT==1 and mode fault detection is enabled (MR.MODFDIS==0), the SPI module will not start a data transfer.

**Fix/Workaround**

Disable mode fault detection by writing a one to MR.MODFDIS.

4. **Disabling SPI has no effect on the SR.TDRE bit**

Disabling SPI has no effect on SR.TDRE whereas the write data command is filtered when SPI is disabled. This means that as soon as the SPI is disabled it becomes impossible to reset the SR.TDRE bit by writing to TDR. So if the SPI is disabled during a PDCA transfer, the PDCA will continue to write data to TDR (as SR.TDRE stays high) until its buffer is empty, and all data written after the disable command is lost.

**Fix/Workaround**

Disable the PDCA, add 2 NOP (minimum), and disable the SPI. To continue the transfer, enable the SPI and the PDCA.

## 5. SPI mode fault detection enable causes incorrect behavior

When mode fault detection is enabled (MR.MODFDIS==0), the SPI module may not operate properly.

### Fix/Workaround

Always disable mode fault detection before using the SPI by writing a one to MR.MODFDIS.

## 10.2.9 TWI

### 1. TWIM.SR.IDLE goes high immediately when NAK is received

When a NAK is received and there is a non-zero number of bytes to be transmitted, SR.IDLE goes high immediately and does not wait for the STOP condition to be sent. This does not cause any problem just by itself, but can cause a problem if software waits for SR.IDLE to go high and then immediately disables the TWIM by writing a one to CR.MDIS. Disabling the TWIM causes the TWCK and TWD pins to go high immediately, so the STOP condition will not be transmitted correctly.

### Fix/Workaround

If possible, do not disable the TWIM. If it is absolutely necessary to disable the TWIM, there must be a software delay of at least two TWCK periods between the detection of SR.IDLE==1 and the disabling of the TWIM.

## 10.2.10 PWMA

### 1. BUSY bit is never cleared after writes to the Control Register (CR)

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR when the PWMA is disabled (CR.EN==0), the BUSY bit in the Status Register (SR.BUSY) will be set, but never cleared.

### Fix/Workaround

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR, make sure the PWMA is enabled, or simultaneously enable the PWMA by writing a one to CR.EN.

### 2. Incoming peripheral events are discarded during duty cycle register update

Incoming peripheral events to all applied channels will be discarded if a duty cycle update is received from the user interface in the same PWMA clock period.

### Fix/Workaround

Ensure that duty cycle writes from the user interface are not performed in a PWMA clock period when an incoming peripheral event is expected.

## 10.2.11 CAT

### 1. CAT asynchronous wake will be delayed by one AST peripheral event period

If the CAT detects a condition that should asynchronously wake the chip in Static mode, the asynchronous wake will not occur until the next AST event. For example, if the AST is generating peripheral events to the CAT every 50 milliseconds, and the CAT detects a touch at t=9200 milliseconds, the asynchronous wake will occur at t=9250 milliseconds.

### Fix/Workaround

None.

## 10.2.12 aWire

### 1. aWire CPU clock speed robustness

The aWire memory speed request command counter wraps at clock speeds below approximately 5kHz.

### Fix/Workaround

None.

**2. The aWire debug interface is reset after leaving Shutdown mode**

If the aWire debug mode is used as debug interface and the program enters Shutdown mode, the aWire interface will be reset when the device receives a wakeup either from the WAKE\_N pin or the AST.

**Fix/Workaround**

None.

**10.2.13 I/O Pins**

**1. PA17 has low ESD tolerance**

PA17 only tolerates 500V ESD pulses (Human Body Model).

**Fix/Workaround**

Care must be taken during manufacturing and PCB design.

**10.2.14 Chip**

**1. Increased Power Consumption in VDDIO in sleep modes**

If the OSC0 is enabled in crystal mode when entering a sleep mode where the OSC0 is disabled, this will lead to an increased power consumption in VDDIO.

**Fix/Workaround**

Solution 1: Disable the OSC0 by writing a zero to the Oscillator Enable bit in the System Control Interface (SCIF) Oscillator Control Register (SCIF.OSC0CTRL.OSCEN) before going to any sleep mode where the OSC0 is disabled

Solution 2: Pull down or up XIN0 and XOUT0 with 1 Mohm resistor.

**2. In 3.3V Single Supply Mode the Analog Comparator inputs affects the device's ability to start**

When using the 3.3V Single Supply Mode the state of the Analog Comparator input pins can affect the device's ability to release POR reset.

This is due to an interaction between the Analog Comparator input pins and the POR circuitry. The issue is not present in the 1.8V Single Supply Mode or the 3.3V Supply mode with 1.8V Regulated I/O Lines.

**Fix/Workaround:**

ACREFN (pin PA16) must be connected to GND until the POR reset is released and the Analog Comparator inputs should not be driven higher than 1.0V until the POR reset is released.

**10.3 Rev. C**

Not sampled.

**10.4 Rev. B**

**10.4.1 Processor and Architecture**

**1. Privilege violation when using interrupts in application mode with protected system stack**

If the system stack is protected by the MPU and an interrupt occurs in application mode, an MPU DTLB exception will occur.

**Fix/Workaround**

Make a DTLB Protection (Write) exception handler which permits the interrupt request to be handled in privileged mode.

**2. Hardware breakpoints may corrupt MAC results**

Hardware breakpoints on MAC instructions may corrupt the destination register of the MAC instruction.

**Fix/Workaround**

Place breakpoints on earlier or later instructions.

**3. RETS behaves incorrectly when MPU is enabled**

RETS behaves incorrectly when MPU is enabled and MPU is configured so that system stack is not readable in unprivileged mode.

**Fix/Workaround**

Make system stack readable in unprivileged mode, or return from supervisor mode using rete instead of rets. This requires:

1. Changing the mode bits from 001 to 110 before issuing the instruction. Updating the mode bits to the desired value must be done using a single mtsr instruction so it is done atomically. Even if this step is described in general as not safe in the UC technical reference manual, it is safe in this very specific case.
2. Execute the RETE instruction.

**10.4.2 FLASHCDW**

**1. Flash Selfprogramming may fail in one wait state mode**

Writes in flash and user pages may fail if executing code located in the address space mapped to the flash and if the flash controller is configured in one wait state mode (the Flash Wait State bit in the Flash Control Register (FCR.FWS) is 1).

**Fix/Workaround**

Solution 1: Configure the flash controller in zero wait state mode (FCR.FWS=0).

Solution 2: Configure the HMATRIX master 1 (CPU Instruction) to use the unlimited burst length transfer mode (MCFG1.ULBT=0) and the HMATRIX slave 0 (FLASHCDW) to use the maximum slot cycle limit (SCFG0.SLOT\_CYCLE=255).

**2. Chip Erase**

When performing a chip erase, the device may report that it is protected (IR=0x11) and that chiperase failed, even if the chip erase was succesful.

**Fix/Workaround**

Perform a reset before any further read and programming.

**3. Fuse Programming**

Programming of fuses does not work.

**Fix/Workaround**

Do not program fuses. All fuses will be erased during chiperase command.

**4. Wait 500ns before reading from the flash after switching read mode**

After switching between normal read mode and high-speed read mode, the application must wait at least 500ns before attempting any access to the flash.

**Fix/Workaround**

Solution 1: Make sure that the appropriate instructions are executed from RAM, and that a waiting-loop is executed from RAM waiting 500ns or more before executing from flash.

Solution 2: Execute from flash with a clock with period longer than 500ns. This guarantees that no new read access is attempted before the flash has had time to settle in the new read mode.

**5. VERSION register reads 0x100**

The VERSION register reads 0x100 instead of 0x102.

**Fix/Workaround**

None.

### 10.4.3 HMATRIX

1. **In the PRAS and PRBS registers, the MxPR fields are only two bits**  
In the PRAS and PRBS registers MxPR fields are only two bits wide, instead of four bits. The unused bits are undefined when reading the registers.  
**Fix/Workaround**  
Mask undefined bits when reading PRAS and PRBS.

### 10.4.4 SAU

1. **The SR.IDLE bit reads as zero**  
The IDLE bit in the Status Register (SR.IDLE) reads as zero.  
**Fix/Workaround**  
None.
2. **Open Mode is not functional**  
The Open Mode is not functional.  
**Fix/workaround**  
None.
3. **VERSION register reads 0x100**  
The VERSION register reads 0x100 instead of 0x110.  
**Fix/Workaround**  
None.

### 10.4.5 PDCA

1. **PCONTROL.CHxRES is nonfunctional**  
PCONTROL.CHxRES is nonfunctional. Counters are reset at power-on, and cannot be reset by software.  
**Fix/Workaround**  
SW needs to keep history of performance counters.
2. **Transfer error will stall a transmit peripheral handshake interface**  
If a transfer error is encountered on a channel transmitting to a peripheral, the peripheral handshake of the active channel will stall and the PDCA will not do any more transfers on the affected peripheral handshake interface.  
**Fix/workaround**  
Disable and then enable the peripheral after the transfer error.
3. **VERSION register reads 0x120**  
The VERSION register reads 0x120 instead of 0x122.  
**Fix/Workaround**  
None.

### 10.4.6 Power Manager

1. **Clock sources will not be stopped in Static mode if the difference between CPU and PBx division factor is larger than 4**  
If the division factor between the CPU/HSB and PBx frequencies is more than 4 when entering a sleep mode where the system RC oscillator (RCSYS) is turned off, the high speed clock sources will not be turned off. This will result in a significantly higher power consumption during the sleep mode.  
**Fix/Workaround**

Before going to sleep modes where RCSYS is stopped, make sure the division factor between the CPU/HSB and PBx frequencies is less than or equal to 4.

## 2. Disabling POR33 may generate spurious reset

Depending on operating conditions, POR33 may generate a spurious reset in one of the following cases:

- When POR33 is disabled from the user interface.
- When SM33 supply monitor is enabled.
- When entering Shutdown mode while debugging the chip using JTAG or aWire interface.

In the listed cases, writing a one to the bit VREGCR.POR33MASK in the System Control Interface (SCIF) to mask the POR33 reset will be ineffective.

### Fix/Workaround

- Do not disable POR33 using the user interface.
- Do not use the SM33 supply monitor.
- Do not enter Shutdown mode if a debugger is connected to the chip.

## 3. CONFIG register reads 0x4F

The CONFIG register reads 0x4F instead of 0x43.

### Fix/Workaround

None.

## 4. PB writes via debugger in sleep modes are blocked during sleepwalking

During sleepwalking, PB writes performed by a debugger will be discarded by all PB modules except the module that is requesting the clock.

### Fix/Workaround

None.

## 5. VERSION register reads 0x400

The VERSION register reads 0x400 instead of 0x411.

### Fix/Workaround

None.

## 6. WCAUSE register should not be used

The WCAUSE register should not be used.

### Fix/Workaround

None.

## 7. Static mode cannot be entered if the WDT is using OSC32K

If the WDT is using OSC32K as clock source and the user tries to enter Static mode, the Deepstop mode will be entered instead.

### Fix/Workaround

None.

## 8. It is not possible to mask the request clock requests

It is not possible to mask the request clock requests using PPCR.

### Fix/Workaround

None.

## 9. Clock failure detector (CFD) does not work

The clock failure detector does not work.

### Fix/Workaround

None.

## 10. Instability when exiting sleep walking

If all the following operating conditions are true, exiting sleep walking might lead to instability:

-The OSC0 is enabled in external clock mode (OSCCTRL0.OSCEN == 1 and OSCCTRL0.MODE == 0)

-A sleep mode where the OSC0 is automatically disabled is entered

-The chip enters sleep walking

**Fix/Workaround**

Do not run OSC0 in external clock mode if sleep walking is expected to be used.

## 10.4.7 SCIF

### 1. The DFLL should be slowed down before disabled

The frequency of the DFLL should be set to minimum before disabled.

**Fix/Workaround**

Before disabling the DFLL the value of the COARSE register should be set to zero.

### 2. Writing to ICR masks new interrupts received in the same clock cycle

Writing to ICR masks any new SCIF interrupt received in the same clock cycle, regardless of write value.

**Fix/Workaround**

For every interrupt except BODDET, SM33DET, and VREGOK the CLKSР register can be read to detect new interrupts. BODDET, SM33DET, and VREGOK interrupts will not be generated if they occur when writing to ICR.

### 3. FINE value for DFLL is not correct when dithering is disabled

In open loop mode, the FINE value used by the DFLL DAC is offset by two compared to the value written to the DFLL0CONF.FINE field. I.e. the value to the DFLL DAC is DFLL0CONF.FINE-0x002. If DFLL0CONF.FINE is written to 0x000, 0x001, or 0x002 the value to the DFLL DAC will be 0x1FE, 0x1FF, or 0x000 respectively.

**Fix/Workaround**

Write the desired value added by two to the DFLL0CONF.FINE field.

### 4. BODVERSION register reads 0x100

The BODVERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

### 5. BRIFA is non-functional

BRIFA is non-functional.

**Fix/Workaround**

None.

### 6. VREGCR.DEEPMODEDISABLE bit is not readable

VREGCR.DEEPMODEDISABLE bit is not readable.

**Fix/Workaround**

None.

### 7. DFLL step size should be 7 or lower below 30 MHz

If max step size is above 7, the DFLL might not lock at the correct frequency if the target frequency is below 30 MHz.

**Fix/Workaround**

If the target frequency is below 30 MHz, use max step size (DFLL0MAXSTEP.MAXSTEP) of 7 or lower.

**8. Generic clock sources are kept running in sleep modes**

If a clock is used as a source for a generic clock when going to a sleep mode where clock sources are stopped, the source of the generic clock will be kept running. Please refer to the Power Manager chapter for details about sleep modes.

**Fix/Workaround**

Disable generic clocks before going to sleep modes where clock sources are stopped to save power.

**9. DFLL clock is unstable with a fast reference clock**

The DFLL clock can be unstable when a fast clock is used as reference clock in closed loop mode.

**Fix/Workaround**

Use the 32 KHz crystal oscillator clock or a clock with similar frequency as DFLLIF reference clock.

**10. DFLLIF indicates coarse lock too early**

The DFLLIF might indicate coarse lock too early, the DFLL will lose coarse lock and regain it later.

**Fix/Workaround**

Use max step size (DFLL0MAXSTEP.MAXSTEP) of 4 or higher.

**11. DFLLIF dithering does not work**

The DFLLIF dithering does not work.

**Fix/Workaround**

None.

**12. SCIF VERSION register reads 0x100**

The VERSION register reads 0x100 instead of 0x102.

**Fix/Workaround**

None.

**13. DFLLVERSION register reads 0x200**

The DFLLVERSION register reads 0x200 instead of 0x201.

**Fix/Workaround**

None.

**14. RCCRVERSION register reads 0x100**

The RCCRVERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

**15. OSC32VERSION register reads 0x100**

The OSC32VERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

**16. VREGVERSION register reads 0x100**

The VREGVERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

**17. RC120MVERSION register reads 0x100**

The RC120MVERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

**18. GCLK5 is non-functional**

GCLK5 is non-functional.

**Fix/Workaround**

None.

**19. DFLLIF might loose fine lock when dithering is disabled**

When dithering is disabled, and fine lock has been acquired the DFLL might loose the fine lock resulting in a up to 20% over-/undershoot.

**Fix/Workaround**

Solution 1: When the DFLL is used as main clock source the target frequency of the DFLL should be 20% below the maximum operating frequency of the CPU. Don't use the DFLL as clock source for frequency sensitive applications.

Solution 2: Do not use the DFLL in closed loop mode.

**20. PCLKSR.OSC32RDY bit might not be cleared after disabling OSC32K**

In some cases the OSC32RDY bit in the PCLKSR register will not be cleared when OSC32K is disabled.

**Fix/Workaround**

When re-enabling the OSC32K, read the PCLKSR.OSC32RDY bit. If this bit is:

0: Follow normal procedures.

1: Ignore the PCLKSR.OSC32RDY and ISR.OSC32RDY bit. Use the Frequency Meter (FREQM) to determine if the OSC32K clock is ready. The OSC32K clock is ready when the FREQM measures a non-zero frequency.

**10.4.8 AST**

**1. AST wake signal is released one AST clock cycle after the BUSY bit is cleared**

After writing to the Status Clear Register (SCR) the wake signal is released one AST clock cycle after the BUSY bit in the Status Register (SR.BUSY) is cleared. If entering sleep mode directly after the BUSY bit is cleared the part will wake up immediately.

**Fix/Workaround**

Read the Wake Enable Register (WER) and write this value back to the same register. Wait for BUSY to clear before entering sleep mode.

**10.4.9 WDT**

**1. Clearing of the WDT in window mode**

In window mode, if the WDT is cleared  $2^{TBAN}$  CLK\_WDT cycles after entering the window, the counter will be cleared, but will not exit the window. If this occurs, the SR.WINDOW bit will not be cleared after clearing the WDT.

**Fix/Workaround**

Check SR.WINDOW immediately after clearing the WDT. If set then clear the WDT once more.

**2. VERSION register reads 0x400**

The VERSION register reads 0x400 instead of 0x402.

**Fix/Workaround**

None.

**3. Clearing the Watchdog Timer (WDT) counter in second half of timeout period will issue a Watchdog reset**

If the WDT counter is cleared in the second half of the timeout period, the WDT will immediately issue a Watchdog reset.

**Fix/Workaround**

Use twice as long timeout period as needed and clear the WDT counter within the first half of the timeout period. If the the WDT counter is cleared after the first half of the timeout period, you will get a Watchdog reset immediately. If the WDT counter is not cleared at all, the time before the reset will be twice as long as needed.

## 10.4.10 FREQM

**1. Measured clock (CLK\_MSR) sources 15-17 are shifted**

CLKSEL = 14 selects the RC120M AW clock, CLKSEL = 15 selects the RC120M clock, and CLKSEL = 16 selects the RC32K clock as source for the measured clock (CLK\_MSR).

**Fix/Workaround**

None.

**2. GCLK5 can not be used as source for the CLK\_MSR**

The frequency for GCLK5 can not be measured by the FREQM.

**Fix/Workaround**

None.

## 10.4.11 GPIO

**1. GPIO interrupt can not be cleared when interrupts are disabled**

The GPIO interrupt can not be cleared unless the interrupt is enabled for the pin.

**Fix/Workaround**

Enable interrupt for the corresponding pin, then clear the interrupt.

**2. VERSION register reads 0x210**

The VERSION register reads 0x210 instead of 0x211.

**Fix/Workaround**

None.

## 10.4.12 USART

**1. The RTS output does not function correctly in hardware handshaking mode**

The RTS signal is not generated properly when the USART receives data in hardware handshaking mode. When the Peripheral DMA receive buffer becomes full, the RTS output should go high, but it will stay low.

**Fix/Workaround**

Do not use the hardware handshaking mode of the USART. If it is necessary to drive the RTS output high when the Peripheral DMA receive buffer becomes full, use the normal mode of the USART. Configure the Peripheral DMA Controller to signal an interrupt when the receive buffer is full. In the interrupt handler code, write a one to the RTSDIS bit in the USART Control Register (CR). This will drive the RTS output high. After the next DMA transfer is started and a receive buffer is available, write a one to the RTSEN bit in the USART CR so that RTS will be driven low.

## 10.4.13 SPI

**1. SPI disable does not work in SLAVE mode**

SPI disable does not work in SLAVE mode.

**Fix/Workaround**

Read the last received data, then perform a software reset by writing a one to the Software Reset bit in the Control Register (CR.SWRST).

**2. SPI Bad Serial Clock Generation on 2nd chip select when SCBR==1, CPOL==1, and NCPHA==0**

When multiple chip selects are in use, if one of the baudrates is equal to 1 (CSRn.SCBR==1) and one of the others is not equal to 1, and CSRn.CPOL==1 and CSRn.NCPHA==0, an additional pulse will be generated on SCK.

**Fix/Workaround**

When multiple chip selects are in use, if one of the baudrates is equal to 1, the others must also be equal to 1 if CSRn.CPOL==1 and CSRn.NCPHA==0.

**3. SPI data transfer hangs with CSR0.CSAAT==1 and MR.MODFDIS==0**

When CSR0.CSAAT==1 and mode fault detection is enabled (MR.MODFDIS==0), the SPI module will not start a data transfer.

**Fix/Workaround**

Disable mode fault detection by writing a one to MR.MODFDIS.

**4. Disabling SPI has no effect on the SR.TDRE bit**

Disabling SPI has no effect on SR.TDRE whereas the write data command is filtered when SPI is disabled. This means that as soon as the SPI is disabled it becomes impossible to reset the SR.TDRE bit by writing to TDR. So if the SPI is disabled during a PDCA transfer, the PDCA will continue to write data to TDR (as SR.TDRE stays high) until its buffer is empty, and all data written after the disable command is lost.

**Fix/Workaround**

Disable the PDCA, add 2 NOP (minimum), and disable the SPI. To continue the transfer, enable the SPI and the PDCA.

**6. SPI mode fault detection enable causes incorrect behavior**

When mode fault detection is enabled (MR.MODFDIS==0), the SPI module may not operate properly.

**Fix/Workaround**

Always disable mode fault detection before using the SPI by writing a one to MR.MODFDIS.

## 10.4.14 TWI

**1. TWIM Version Register reads zero**

TWIM Version Register (VR) reads zero instead of 0x101.

**Fix/Workaround**

None.

**2. TWIS Version Register reads zero**

TWIS Version Register (VR) reads zero instead of 0x112.

**Fix/Workaround**

None.

**3. TWIS CR.STREN does not work in deep sleep modes**

When the device is in Stop, DeepStop, or Static mode, address reception will not wake the device if both CR.SOAM and CR.STREN are one.

**Fix/Workaround**

Do not write both CR.STREN and CR.SOAM to one if the device needs to wake from deep sleep modes.

**4. TWI pins are not SMBus compliant**

The TWI pins draws current when the pins are supplied with 3.3V and the part is left unpowered.

**Fix/Workaround**

None.

**5. PA21, PB04, and PB05 are not 5V tolerant**

Pins PA21, PB04, and PB05 are only 3.3V tolerant, not 5V tolerant.

**Fix/Workaround**

None.

**6. PB04 SMBALERT function should not be used**

The SMBALERT function from TWIMS0 should not be selected on pin PB04.

**Fix/Workaround**

None.

**7. TWIMS0.TWCK on PB05 is non-functional**

TWIMS0.TWCK on PB05 is non-functional.

**Fix/Workaround**

Use TWI0.TWCK on other pins.

**8. TWIM STOP bit in IMR always read as zero**

The STOP bit in IMR always reads as zero.

**Fix/Workaround**

None.

**9. TWIM.SR.IDLE goes high immediately when NAK is received**

When a NAK is received and there is a non-zero number of bytes to be transmitted, SR.IDLE goes high immediately and does not wait for the STOP condition to be sent. This does not cause any problem just by itself, but can cause a problem if software waits for SR.IDLE to go high and then immediately disables the TWIM by writing a one to CR.MDIS. Disabling the TWIM causes the TWCK and TWD pins to go high immediately, so the STOP condition will not be transmitted correctly.

**Fix/Workaround**

If possible, do not disable the TWIM. If it is absolutely necessary to disable the TWIM, there must be a software delay of at least two TWCK periods between the detection of SR.IDLE==1 and the disabling of the TWIM.

**10. Disabled TWIM drives TWD and TWCK low**

When the TWIM is disabled, it drives the TWD and TWCK signals with logic level zero. This can lead to communication problems with other devices on the TWI bus.

**Fix/Workaround**

Enable the TWIM first and then enable the TWD and TWCK peripheral pins in the GPIO controller. If it is necessary to disable the TWIM, first disable the TWD and TWCK peripheral pins in the GPIO controller and then disable the TWIM.

## 10.4.15 PWMA

**1. PARAMETER register reads 0x2424**

The PARAMETER register reads 0x2424 instead of 0x24.

**Fix/Workaround**

None.

**2. Open drain mode does not work**

The open drain mode does not work.

**Fix/Workaround**

None.

**3. VERSION register reads 0x100**

The VERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

**4. Writing to the duty cycle registers when the timebase counter overflows can give an undefined result**

The duty cycle registers will be corrupted if written when the timebase counter overflows. If the duty cycle registers are written exactly when the timebase counter overflows at TOP, the duty cycle registers may become corrupted.

**Fix/Workaround**

Write to the duty cycle registers only directly after the Timebase Overflow bit in the status register is set.

**5. BUSY bit is never cleared after writes to the Control Register (CR)**

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR when the PWMA is disabled (CR.EN==0), the BUSY bit in the Status Register (SR.BUSY) will be set, but never cleared.

**Fix/Workaround**

When writing a non-zero value to CR.TOP, CR.SPREAD, or CR.TCLR, make sure the PWMA is enabled, or simultaneously enable the PWMA by writing a one to CR.EN.

**6. Incoming peripheral events are discarded during duty cycle register update**

Incoming peripheral events to all applied channels will be discarded if a duty cycle update is received from the user interface in the same PWMA clock period.

**Fix/Workaround**

Ensure that duty cycle writes from the user interface are not performed in a PWMA clock period when an incoming peripheral event is expected.

**10.4.16 TC**

**1. When the main clock is RCSYS, TIMER\_CLOCK5 is equal to CLK\_PBA**

When the main clock is generated from RCSYS, TIMER\_CLOCK5 is equal to CLK\_PBA and not CLK\_PBA/128.

**Fix/Workaround**

None.

**10.4.17 ADCIFB**

**1. Pendetect in sleep modes without CLK\_ADCIFB will not wake the system**

The pendetect will not wake the system from a sleep mode if the clock for the ADCIFB (CLK\_ADCIFB) is turned off.

**Fix/Workaround**

Use a sleep mode where CLK\_ADCIFB is not turned off to wake the part using pendetect.

**2. 8-bit mode is not working**

Do not use the 8-bit mode of the ADCIFB.

**Fix/Workaround**

Use the 10-bit mode and shift right by 2 bits.

**3. ADC channels six to eight are non-functional**

ADC channels six to eight are non-functional.

**Fix/Workaround**

None.

**4. VERSION register reads 0x100**

The VERSION register reads 0x100 instead of 0x101.

**Fix/Workaround**

None.

## 10.4.18 ACIFB

**1. Negative offset**

The static offset of the analog comparator is approximately -50mV.

**Fix/Workaround**

None.

**2. Generic clock sources in sleep modes**

The ACIFB should not use RC32K or CLK\_1K as generic clock source if the chip uses sleep modes.

**Fix/Workaround**

None.

**3. VERSION register reads 0x200**

The VERSION register reads 0x200 instead of 0x212.

**Fix/Workaround**

None.

**4. CONFW.WEVSRC and CONFW.WEVEN are not correctly described in the user interface**

CONFW.WEVSRC is only two bits instead of three bits wide. Only values 0, 1, and 2 can be written to this register. CONFW.WEVEN is in bit position 10 instead of 11.

**Fix/Workaround**

Only write values 0, 1, and 2 to CONFW.WEVSRC. When reading CONFW.WEVSRC, disregard the third bit. Read/write bit 10 to access CONFW.WEVEN.

## 10.4.19 CAT

**1. Switch off discharge current when reaching 0V**

The discharge current will switch off when reaching MGCFG1.MAX, not when reaching 0V.

**Fix/Workaround**

None.

**2. CAT external capacitors are not clamped to ground when CAT is idle**

The CAT module does not clamp the external capacitors to ground when it is idle. The capacitors are left floating, so they could accumulate small amounts of charge.

**Fix/workaround**

None.

**3. DISHIFT field is stuck at zero**

The DISHIFT field in the MGCFG1, TGACFG1, TGBCFG1, and ATCFG1 registers is stuck at zero and cannot be written to a different value. Capacitor discharge time will be determined only by the DILEN field.

**Fix/Workaround**

None.

**4. MGCFG2.ACCTRL bit is stuck at zero**

The ACCTRL bit in the MGCFG2 register is stuck at zero and cannot be written to one. The analog comparators will be constantly enabled.

**Fix/Workaround**

None.

**5. MGCFG2.CONSEN field is stuck at zero**

The CONSEN field in the MGCFG2 register is stuck at zero and cannot be written to a different value. The CAT consensus filter does not function properly, so termination of QMatrix data acquisition is controlled only by the MAX field in MGCFG1.

**Fix/Workaround**

None.

**6. VERSION register reads 0x100**

The VERSION register reads 0x100 instead of 0x200.

**Fix/Workaround**

None.

**1. CAT asynchronous wake will be delayed by one AST peripheral event period**

If the CAT detects a condition that should asynchronously wake the chip in Static mode, the asynchronous wake will not occur until the next AST event. For example, if the AST is generating peripheral events to the CAT every 50 milliseconds, and the CAT detects a touch at t=9200 milliseconds, the asynchronous wake will occur at t=9250 milliseconds.

**Fix/Workaround**

None.

## 10.4.20 GLOC

**1. GLOC is non-functional**

Glue Logic Controller (GLOC) is non-functional.

**Fix/Workaround**

None.

## 10.4.21 aWire

**1. aWire PB mapping and PB clock mask number**

The aWire PB has a different PB address and PB clock mask number.

**Fix/Workaround**

Use aWire PB address 0xFFFF6C00 and PB clock (PBAMASK) 24.

**2. SAB multiaccess reads are not working**

Reading more than one word, halfword, or byte in one command is not working correctly.

**Fix/Workaround**

Split the access into several single word, halfword, or byte accesses.

**3. If a reset happens during the last SAB write, the aWire will stall**

If a reset happens during the last word, halfword, or byte write the aWire will wait forever for an acknowledge from the SAB.

**Fix/Workaround**

Reset the aWire by keeping the RESET\_N line low for 100ms.

**4. aWire enable does not work in Static mode**

aWire enable does not work in Static mode.

**Fix/Workaround**

None.

**5. VERSION register reads 0x200**

The VERSION register reads 0x200 instead of 0x210.

**Fix/Workaround**

None.

**6. The aWire debug interface is reset after leaving Shutdown mode**

If the aWire debug mode is used as debug interface and the program enters Shutdown mode, the aWire interface will be reset when the device receives a wakeup either from the WAKE\_N pin or the AST.

**Fix/Workaround**

None.

#### 10.4.22 I/O Pins

**1. PB10 is not 3.3V tolerant**

PB10 should be grounded on the PCB and left unused.

**Fix/Workaround**

None.

**2. Analog multiplexing consumes extra power**

Current consumption on VDDIO increases when the voltage on analog inputs is close to VDDIO/2.

**Fix/Workaround**

None.

**3. PA02, PB01, PB04, PB05, and RESET\_N have half of the pull-up strength**

Pins PA02, PB01, PB04, PB05, and RESET\_N have half of the specified pull-up strength.

**Fix/Workaround**

None.

**4. OCD MCKO and MDO[3] are swapped in the AUX1 mapping**

When using the OCD AUX1 mapping of trace signals MDO[3] is located on pin PB05 and MCKO is located on PB01.

**Fix/Workaround**

Swap pins PB01 and PB05 if using OCD AUX1.

**5. The JTAG is enabled at power up**

The JTAG function on pins PA00, PA01, PA02, and PA03, are enabled after startup. Normal I/O module functionality is not possible on these pins.

**Fix/Workaround**

Add a 10kOhm pullup on the reset line.

#### 10.4.23 Chip

**1. Power consumption in static mode is too high**

Power consumption in static mode is too high when PA21 is high.

**Fix/Workaround**

Ensure PA21 is low.

**2. Shutdown mode is not functional**

Do not enter Shutdown mode.

**Fix/Workaround**

None.

**3. VDDIN current consumption increase above 1.8V**

When VDDIN increases above 1.8V, current on VDDIN increases with up to 40 $\mu$ A.

**Fix/Workaround**

None.

**4. Increased Power Consumption in VDDIO in sleep modes**

If the OSC0 is enabled in crystal mode when entering a sleep mode where the OSC0 is disabled, this will lead to an increased power consumption in VDDIO.

**Fix/Workaround**

Solution 1: Disable the OSC0 by writing a zero to the Oscillator Enable bit in the System Control Interface (SCIF) Oscillator Control Register (SCIF.OSC0CTRL.OSCEN) before going to any sleep mode where the OSC0 is disabled

Solution 2: Pull down or up XIN0 and XOUT0 with 1 Mohm resistor.

## 11. Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

### 11.1 Rev. D - 06/2010

1. Ordering Information: Ordering code for TQFP ES changed from AT32UC3L064-AUES to AT32UC3L064-AUTES. TLLGA48 Tray option added.

### 11.2 Rev. C - 06/2010

1. Features and Description: Added QTouch library support.
2. USART: Description of unimplemented features removed.
3. Electrical Characteristics: Power Consumption numbers updated. Flash timing numbers added.

### 11.3 Rev. B - 05/2010

1. Package and Pinout: Added pinout figure for TLLGA48 package.
2. Package and Pinout, GPIO function multiplexing: TWIMS0-TWCK on PA20 removed. ADCIFB-AD[3] on PA17 removed, number of ADC channels are 8, not 9.
3. I/O Lines Considerations: Added: Following pins have high-drive capability: PA02, PA06, PA08, PA09, and PB01.  
Some TWI0 pins are SMBUS compliant (PA21, PB04, PB05).
4. HMATRIX Masters: PDCA is master 4, not master 3. SAU is master 3, not master 4.
5. SAU: IDLE bit added in the Status Register.
6. PDCA: Number of PDCA performance monitors is device dependent.
7. Peripheral Event System: Chapter updated.
8. PM: Bits in RCAUSE registers removed and renamed (JTAGHARD and AWIREHARD renamed to JTAG and AWIRE respectively, JTAG and AWIRE removed. BOD33 bit removed).
9. PM: RCAUSE.BOD33 bit removed. SM33 reset will be detected as a POR reset.
10. PM: WDT can be used as wake-up source if WDT is clocked from 32KHz oscillator.
11. PM: Entering Shutdown mode description updated.
12. SCIF: DFLL output frequency is 40-150MHz, not 20-150MHz or 30-150MHz.
13. SCIF: Temperature sensor is connected to ADC channel 9, not 7.
14. SCIF: Updated the oscillator connection figure for OSC0
15. GPIO: Removed unimplemented features (pull-down, buskeeper, drive strength, slew rate, schmitt trigger, open drain).

16. SPI: RDR.PCS field removed (RDR[19:16]).
17. TWIS: Figures updated.
18. ADCIFB: The sample and hold time and the startup time formulas have been corrected (ADC Configuration Register).
19. ADCIFB: Updated ADC signal names.
20. ACIFB: CONFW.WEVSRC is bit 8-10, CONFW.EWEVEN is bit 11. CONF.EVENP and CONF.EVENN bits are swapped.
21. CAT: Matrix size is 16 by 8, not 18 by 8.
22. Electrical Characteristics: General update.
23. Mechanical Characteristics: Added numbers for package drawings.
24. Mechanical Characteristics: In the TQFP-48 package drawing the Lead Coplanarity is 0.102mm, not 0.080mm.
25. Ordering Information: Ordering code for TLLGA-48 package updated.

#### **11.4 Rev. A – 06/2009**

1. Initial revision.
