## Description

The Hitachi HM628512B is a 4-Mbit static RAM organized 512-kword  $\times$  8-bit. It realizes higher density, higher performance and low power consumption by employing 0.35  $\mu$ m Hi-CMOS process technology. The device, packaged in a 525-mil SOP (foot print pitch width) or 400-mil TSOP TYPE II or 600-mil plastic DIP, is available for high density mounting. The HM628512B is suitable for battery backup system.

## Features

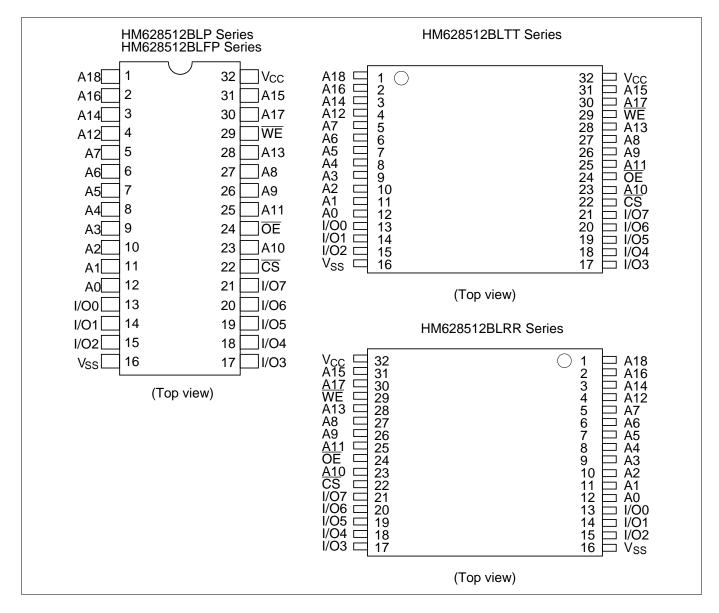

- Single 5 V supply
- Access time: 55/70 ns (max)
- Power dissipation
  - Active: 50 mW/MHz (typ)
  - Standby: 10 µW (typ)
- Completely static memory. No clock or timing strobe required
- Equal access and cycle times
- Common data input and output: Three state output
- Directly TTL compatible: All inputs and outputs
- Battery backup operation

Notes: 1. t<sub>HZ</sub>, t<sub>OHZ</sub> and t<sub>WHZ</sub> are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.

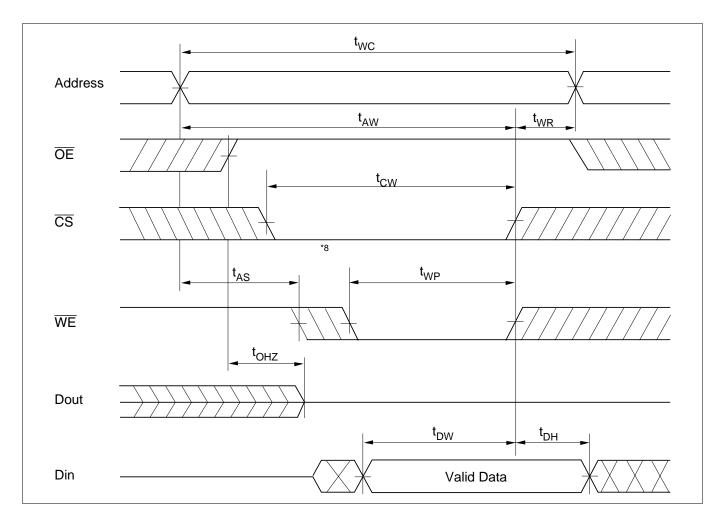

- 2. This parameter is sampled and not 100% tested.
- 3. A write occurs during the overlap  $(t_{WP})$  of a low  $\overline{CS}$  and a low  $\overline{WE}$ . A write begins at the later transition of  $\overline{CS}$  going low or  $\overline{WE}$  going low. A write ends at the earlier transition of  $\overline{CS}$  going high or  $\overline{WE}$  going high.  $t_{WP}$  is measured from the beginning of write to the end of write.
- 4.  $t_{cw}$  is measured from  $\overline{CS}$  going low to the end of write.
- 5.  $t_{AS}$  is measured from the address valid to the beginning of write.
- 6.  $t_{WR}$  is measured from the earlier of  $\overline{WE}$  or  $\overline{CS}$  going high to the end of write cycle.
- 7. During this period, I/O pins are in the output state so that the input signals of the opposite phase to the outputs must not be applied.
- 8. If the CS low transition occurs simultaneously with the WE low transition or after the WE transition, the output remain in a high impedance state.
- 9. Dout is the same phase of the write data of this write cycle.
- 10. Dout is the read data of next address.
- 11. If  $\overline{CS}$  is low during this period, I/O pins are in the output state. Therefore, the input signals of the opposite phase to the outputs must not be applied to them.
- 12. In the write cycle with  $\overline{OE}$  low fixed,  $t_{WP}$  must satisfy the following equation to avoid a problem of data bus contention.  $t_{WP} \ge t_{DW} \min + t_{WHZ} \max$
