# 16-BIT SERIAL-INPUT, CONSTANTCURRENT LATCHED LED DRIVER 

Note that the A6276EA (DIP) and the A6276ELW (SOIC) are electrically identical and share a common terminal number assignment.

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage, $\mathrm{V}_{\mathrm{DD}}$
Output Voltage Range, $\mathrm{V}_{\mathrm{O}}$........................... -0.5 V to +17 V
Output Current, $\mathrm{I}_{\mathrm{O}}$....................... 90 mA
Ground Current, $\mathrm{I}_{\mathrm{GND}}$............... $1475 \mathbf{~ m A}$
Input Voltage Range,
$V_{1}$ $\qquad$ $-\mathbf{0 . 4} \mathrm{V}$ to $\mathrm{V}_{\mathrm{DD}}+\mathbf{0 . 4} \mathrm{V}$
Package Power Dissipation,
$P_{D}$................................... See Graph
Operating Temperature Range,
$\mathrm{T}_{\mathrm{A}}$............................ $\mathbf{- 4 0}{ }^{\circ} \mathrm{C}$ to $+\mathbf{8 5}{ }^{\circ} \mathrm{C}$
Storage Temperature Range,
$\mathrm{T}_{\mathrm{S}}$ $\qquad$ $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$

Caution: These CMOS devices have input static protection (Class 2) but are still susceptible to damage if exposed to extremely high static electrical charges.

The A6276EA and A6276ELW are specifically designed for LEDdisplay applications. Each BiCMOS device includes a 16-bit CMOS shift register, accompanying data latches, and 16 npn constant-current sink drivers. Except for package style and allowable package power dissipation, the two devices are identical.

The CMOS shift register and latches allow direct interfacing with microprocessor-based systems. With a 5 V logic supply, typical serial data-input rates are up to 20 MHz . The LED drive current is determined by the user's selection of a single resistor. A CMOS serial data output permits cascade connections in applications requiring additional drive lines. For inter-digit blanking, all output drivers can be disabled with an ENABLE input high. Similar 8-bit devices are available as the A6275EA and A6275ELW.

Two package styles are provided for through-hole DIP (suffix A) or surface-mount SOIC (suffix LW). Under normal applications, a copper lead frame and low logic-power dissipation allow the dual in-line package to sink maximum rated current through all outputs continuously over the operating temperature range ( $90 \mathrm{~mA}, 0.75 \mathrm{~V}$ drop, $+85^{\circ} \mathrm{C}$. Both devices are also available for operation over the standard temperature range of $-20^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$. To order, change the suffix letter ' $E$ ' to ' S '.

## FEATURES

■ To 90 mA Constant-Current Outputs

- Under-Voltage Lockout
- Low-Power CMOS Logic and Latches
- High Data Input Rate
- Functional Replacement for TB62706BN/BF

Always order by complete part number, e.g., A6276EA.

Dwg. GP-022-3

|  | $\mathrm{~V}_{\mathrm{IL}}$ |  | -0.3 | - | $0.3 \mathrm{~V}_{\mathrm{DD}}$ | V |
| Clock Frequency | $\mathrm{f}_{\mathrm{CK}}$ | Cascade operation | - | - | 10 | MHz |

TIMING REQUIREMENTS and SPECIFICATIONS
(Logic Levels are $\mathrm{V}_{\mathrm{DD}}$ and Ground)

A. Data Active Time Before Clock Pulse(Data Set-Up Time), $\mathrm{t}_{\mathrm{su}(\mathrm{D})}$
$\qquad$ata Active Time After Clock Pulse(Data Hold Time), $\mathrm{t}_{\mathrm{h}(\mathrm{D})}$20 ns
C. Clock Pulse Width, $\mathrm{t}_{\mathrm{w}(\mathrm{CK})}$ ..... 50 ns
D. Time Between Clock Activation and Latch Enable, $\mathrm{t}_{\mathrm{su}(\mathrm{L})}$ ..... 100 ns
E. Latch Enable Pulse Width, $\mathrm{t}_{\mathrm{w}(\mathrm{L})}$ ..... 100 ns
F. Output Enable Pulse Width, $\mathrm{t}_{\mathrm{w}(\mathrm{OE})}$ ..... $4.5 \mu \mathrm{~s}$
NOTE - Timing is representative of a 10 MHz clock.Significantly higher speeds are attainable.— Max. Clock Transition Time, $\mathrm{t}_{\mathrm{r}}$ or $\mathrm{t}_{\mathrm{f}}$
$\qquad$$10 \mu s$

Information present at any register is transferred to the respective latch when the LATCH ENABLE is high (serial-toparallel conversion). The latches will continue to accept new data as long as the LATCH ENABLE is held high. Applications where the latches are bypassed (LATCH ENABLE tied high) will require that the OUTPUT ENABLE input be high during serial data entry.

When the OUTPUT ENABLE input is high, the output source drivers are disabled (OFF). The information stored in the latches is not affected by the OUTPUT ENABLE input. With the OUTPUT ENABLE input low, the outputs are controlled by the state of their respective latches.

## TERMINAL DESCRIPTION

| Terminal No. | Terminal Name | Function |
| :---: | :---: | :--- |
| 1 | GND | Reference terminal for control logic. |
| 2 | SERIAL DATA IN | Serial-data input to the shift-register. |
| 3 | CLOCK | Clock input terminal for data shift on rising edge. |
| 4 | LATCH ENABLE | Data strobe input terminal; serial data is latched with high-level input. |
| $5-20$ | OUT $_{0-15}$ | The 16 current-sinking output terminals. |
| 21 | OUTPUT ENABLE | When (active) low, the output drivers are enabled; when high, all output <br> drivers are turned OFF (blanked). |
| 22 | SERIAL DATA OUT | CMOS serial-data output to the following shift-register. |
| 23 | R $_{\text {EXT }}$ | An external resistor at this terminal establishes the output current for all sink <br> drivers. |
| 24 | SUPPLY | $\left(\mathrm{V}_{\mathrm{DD}}\right)$ The logic supply voltage (typically 5 V). |

## Applications Information

The load current per bit ( $\mathrm{I}_{\mathrm{O}}$ ) is set by the external resistor $\left(\mathrm{R}_{\mathrm{EXT}}\right)$ as shown in the figure below.

Dwg. GP-061
Package Power Dissipation ( $\mathrm{P}_{\mathrm{D}}$ ). The maximum allowable package power dissipation is determined as

$$
\mathrm{P}_{\mathrm{D}}(\max )=\left(150-\mathrm{T}_{\mathrm{A}}\right) / \mathrm{R}_{\theta \mathrm{JJ}} .
$$

The actual package power dissipation is

$$
\mathrm{P}_{\mathrm{D}}(\mathrm{act})=\operatorname{dc}\left(\mathrm{V}_{\mathrm{CE}} \cdot \mathrm{I}_{\mathrm{O}} \cdot 16\right)+\left(\mathrm{V}_{\mathrm{DD}} \bullet \mathrm{I}_{\mathrm{DD}}\right) .
$$

When the load supply voltage is greater than 3 V to 5 V , considering the package power dissipating limits of these devices, or if $\mathrm{P}_{\mathrm{D}}(\mathrm{act})>\mathrm{P}_{\mathrm{D}}(\mathrm{max})$, an external voltage reducer ( $\mathrm{V}_{\mathrm{DROP}}$ ) should be used.

Load Supply Voltage ( $\mathbf{V}_{\text {LED }}$ ). These devices are designed to operate with driver voltage drops ( $\mathrm{V}_{\mathrm{CE}}$ ) of 0.4 V to 0.7 V with LED forward voltages $\left(\mathrm{V}_{\mathrm{F}}\right)$ of 1.2 V to 4.0 V . If higher voltages are dropped across the driver, package power dissipation will be increased significantly. To minimize package power dissipation, it is recommended to use the lowest possible load supply voltage or to set any series dropping voltage ( $\mathrm{V}_{\text {DROP }}$ ) as

$$
\mathrm{V}_{\mathrm{DROP}}=\mathrm{V}_{\mathrm{LED}}-\mathrm{V}_{\mathrm{F}}-\mathrm{V}_{\mathrm{CE}}
$$

with $\mathrm{V}_{\text {DROP }}=\mathrm{I}_{\mathrm{o}} \cdot \mathrm{R}_{\text {DROP }}$ for a single driver, or a Zener diode $\left(\mathrm{V}_{\mathrm{Z}}\right)$, or a series string of diodes (approximately
0.7 V per diode) for a group of drivers. If the available voltage source will cause unacceptable dissipation and series resistors or diode(s) are undesirable, a regulator such as the Sanken Series SAI or Series SI can be used to provide supply voltages as low as 3.3 V .

For reference, typical LED forward voltages are:

| Blue | $3.0-4.0 \mathrm{~V}$ |
| :--- | :---: |
| Green | $1.8-2.2 \mathrm{~V}$ |
| Yellow | $2.0-2.1 \mathrm{~V}$ |
| Amber | $1.9-2.65 \mathrm{~V}$ |
| Red | $1.6-2.25 \mathrm{~V}$ |
| Infrared | $1.2-1.5 \mathrm{~V}$ |

Pattern Layout. This device has a common logicground and power-ground terminal. If ground pattern layout contains large common-mode resistance, and the voltage between the system ground and the LATCH ENABLE or CLOCK terminals exceeds 2.5 V (because of switching noise), these devices may not operate correctly.

## A6276EA

Dimensions in Inches (controlling dimensions)

Dimensions in Millimeters (for reference only)

NOTES: 1. Exact body and lead configuration at vendor's option within limits shown.
2. Lead spacing tolerance is non-cumulative
3. Lead thickness is measured at seating plane or below.
4. Supplied in standard sticks/tubes of 15 devices.
