

VB927 VB927FI

HIGH VOLTAGE IGNITION COIL DRIVER POWER IC

- NO EXTERNAL COMPONENT REQUIRED
- INTEGRATED HIGH VOLTAGE CLAMP
- COIL CURRENT LIMIT INTERNALLY SET
- HIGH RUGGEDNESS

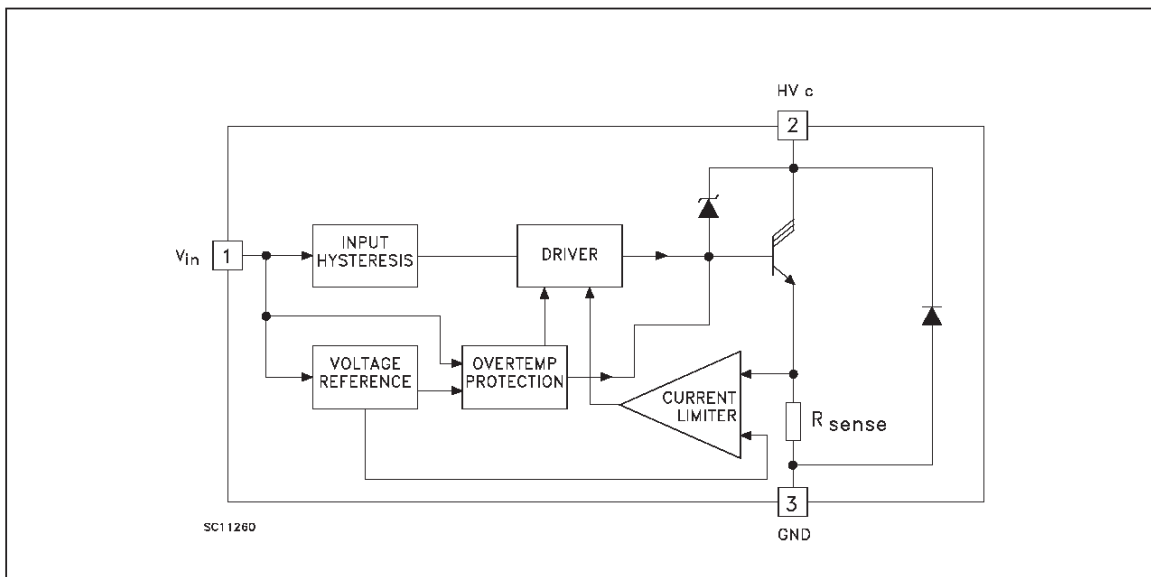

DESCRIPTION

The VB927 is a monolithic high voltage integrated circuit made using STM VIPower Technology, which combines a vertical current flow power trilineon with a coil current limiting circuit and a collector voltage clamping.

The device is peculiarly suitable for application in high performance electronic car ignition, where coil current limitation and voltage clamping are required.

* Coil data: primary resistance $R_c = 0.4 - 0.8\ \Omega$, primary inductance $L_c = 6 - 8\text{ mH}$

** Pulsed: Pulse duration = 300 μs , duty cycle 1.5 %

Note 1 : $T_j \text{ min} = 150\text{ }^\circ\text{C}$ means that the behaviour of the device will not be affected for junction temperature lower then $150\text{ }^\circ\text{C}$. For higher temperature, the thermal protection circuit will begin its action reducing the I_{cl} limit according with the power dissipation. Chip temperature is a function of the R_{th} of the whole system in which the device will be operating.
