

# XC6201

## Series

Positive Voltage Regulators

- ◆ CMOS Low Power Consumption
- ◆ Dropout Voltage : 0.16V @ 100mA,  
0.40V @ 200mA
- ◆ Maximum Output Current : 250mA (V<sub>OUT</sub>=5.0V, TYP)
- ◆ Highly Accurate : ± 2%
- ◆ Output Voltage Range : 1.3V ~ 6.0V
- ◆ SOT-25 / SOT-89 / TO-92 Package
- ◆ Capacitors can be Tantalum or Ceramic

### Applications

- Mobile phones
- Cordless phones
- Cameras, video recorders
- Portable games
- Portable AV equipment
- Reference voltage
- Battery powered equipment

3

### General Description

The XC6201 series are highly precise, low power consumption, positive voltage regulators manufactured using CMOS and laser trimming technologies.

The series provides large currents with a significantly small dropout voltage.

The XC6201 consists of a current limiter circuit, a driver transistor, a precision reference voltage and an error amplifier. Output voltage is selectable in 0.1V steps between 1.3V ~ 6.0V.

SOT-25 (250mW), SOT-89 (500mW) and TO-92 (300mW) packages are available.

### Features

- Maximum Output Current : 250mA (TYP.)
- Dropout Voltage : 0.16V @ 100mA
- Maximum Operating Voltage : 10V
- Output Voltage Range : 1.3V ~ 6.0V  
(selectable in 0.1V steps)
- Highly Accurate : ± 2%
- Low Power Consumption : TYP 2.0 μA
- Operational Temperature Range : -40°C ~ 85°C
- Ultra Small Packages : SOT-25 (250mW),  
SOT-89 (500mW),  
TO-92 (300mW)

Capacitors can be Tantalum or Ceramic

- Note :
1.  $V_{OUT}(T)$  = Specified Output Voltage.
  2.  $V_{OUT}(E)$  = Effective Output Voltage (i.e. the output voltage when " $V_{OUT}(T)+1.0V$ " is provided while maintaining a certain  $I_{OUT}$  value).
  3.  $V_{dif} = \{ V_{IN1} (Note5) - V_{OUT1} (Note4) \}$
  4.  $V_{OUT1}$  = A voltage equal to 98% of the output voltage when a stabilised ( $V_{OUT}(T) + 1.0V$ ) is input.
  5.  $V_{IN1}$  = The input voltage at the time  $V_{OUT1}$  is output (input voltage has been gradually reduced).

## XC6201 Series

### ■ Typical Application Circuit

3

#### < External Capacitors >

The XC6201 requires an output capacitor between the V<sub>OUT</sub> pin and the V<sub>SS</sub> pin in order to obtain stable output voltages. Where output voltage is greater than 1.7V, the output capacitor (C<sub>L</sub>) used should be more than 0.1µF whether using tantalum or low ESR (ceramic, for example) capacitors. Where output voltage is between 1.3V - 1.6V, it is recommended that only a tantalum capacitor of more than 2.2µF be used on the output in order to stabilize operations.

Output Voltage	C <sub>IN</sub>	C <sub>L</sub> (tantalum)	C <sub>L</sub> (low ESR)
1.3V~1.6V	greater than 0.1µF	greater than 2.2µF	-
1.7V~6.0V	greater than 0.1µF	greater than 0.1µF	greater than 0.1µF

## ■ Directions for use

### ● Notes on Use

1. Please use this IC within the stipulated absolute maximum ratings as the IC is liable to malfunction outside of such parameters. When the voltage on  $V_{OUT}$  is larger than that of  $V_{IN}$ , for example, when there are two power supply, please insert schottky diode between  $V_{OUT}$  and  $V_{IN}$  not to exceed the rating of  $V_{OUT}$ .
2. There is a possibility that oscillation may occur as a result of the impedance present between the power supply and the IC's input. Where impedance is  $10\Omega$  or more, please use a capacitor ( $C_{IN}$ ) of at least  $1\mu F$ .  
With a large output current, operations can be stabilised by increasing capacitor size ( $C_{IN}$ ). If  $C_{IN}$  is small and capacitor size ( $C_L$ ) is increased, there is a possibility of oscillation due to input impedance.  
In such cases, operations can be stabilised by either increasing the size of  $C_{IN}$  or decreasing the size of  $C_L$ .
3. Please ensure that output current ( $I_{OUT}$ ) is less than  $P_d + (V_{IN} - V_{OUT})$  and does not exceed the stipulated Continuous Total Power Dissipation value ( $P_d$ ) for the package.
