

FSK Modem Filter

GENERAL DESCRIPTION

The XR-2103 is a Monolithic Switched-Capacitor Filter designed to perform the complete filtering function necessary for a Bell 103 Compatible Modem. The XR-2103 is specifically intended for use with the XR-14412 Modulator/Demodulator to form a complete stand alone two-chip modem. In addition to complete high and low bandpass filters, the XR-2103 contains internal mode switching, auto-zeroing limiter and dedicated duplexer op amp. An on board carrier detect circuit is also included to complete the overall system. Designed for crystal-controlled operation, the XR-2103 operates from a 1.0 MHz crystal or external clock. Buffered clock output is provided for the XR-14412. A self-test circuit is included.

An input amplifier with programmable gain is provided for the receive signals. The XR-2103 contains an internal clock oscillator which accepts either a crystal or an external oscillator of 1 MHz.

The XR-2103, available in a 20 pin package, utilizes CMOS technology for low power operation with a supply voltage range from 4.75V to 6V.

FEATURES

- Single 5 Volt Operation
- Complete On Board Output Active Filters
- Low Supply Current
- Internal Answer/Originate Mode Switching
- Programmable Input Receive Gain
- Carrier Detect Output
- Active Duplexer

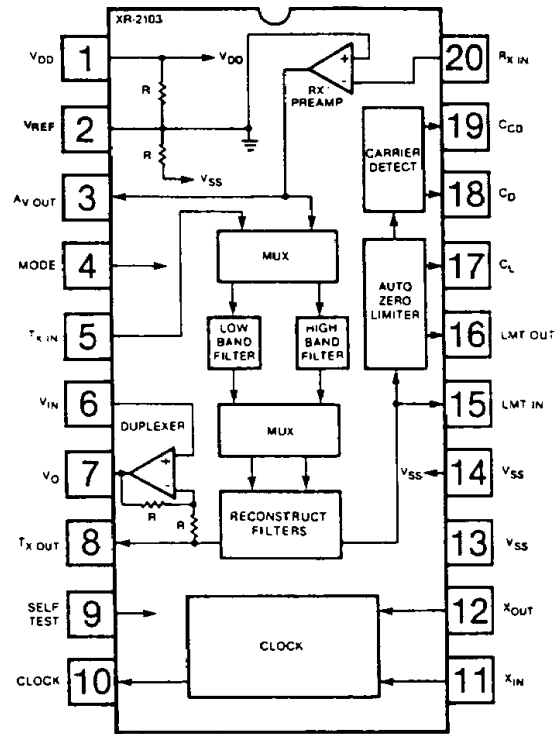

APPLICATIONS

Bell 103 Transmit/Receive Filtering
 Complement to XR-14412 or Other
 Modulators/Demodulators

ABSOLUTE MAXIMUM RATINGS

| | |
|-----------------------------------|--|
| Power Supply | 16V |
| Power Dissipation Plastic Package | 650 mW |
| Derate Above 25°C | 5.0 mW/°C |
| Power Dissipation Ceramic Package | 1.0 W |
| Derate Above 25°C | 8.0 mW/°C |
| Operating Temperature | 0°C to 70°C |
| Storage Temperature | -65°C to 150°C |
| Any Input Voltage | (V _{DD} + 0.5V) to (V _{SS} - 0.5V) |

| XR-2103ACP | Plastic | 0°C to 70°C |
| XR-2103ACN | Ceramic | 0°C to 70°C |
| XR-2103P | Plastic | -20°C to +85°C |

SYSTEM DESCRIPTION

The XR-2103 internally consists of four main signal blocks. They are: input and output multiplexers to route the transmit and receive signals to the proper filter and output, according to the mode input; high and low band filters, 6 poles each, to perform precise bandpass filtering; output RC active filters to perform output reconstruction and filtering; carrier detection circuit for system interfacing.

The XR-2103 can also be interfaced with many microcontrollers for combining a FSK modem with a control or monitoring function.

The XR-2103ACP features tighter output limiter symmetry for easier interfacing with the XR-14412 modulator/demodulator.

XR-2103/2103A

OPERATING PRINCIPLES

The XR-2103 contains all the filtering and multiplexing functions necessary for a Bell 103 type (300 baud) FSK modem. A complete modem requires only the XR-2103, the XR-14412, and telephone line interfacing hardware. A description of the main functional blocks follows.

Bandpass Filtering: Two six pole, 500 Hz bandwidth switched capacitor filters, designed for Bell 103 standard center frequencies of 1170 Hz (low band) and 2125 Hz (high band), constitute the main portion of the device. Both filters feature +4 dB passband gain, 50 dB dynamic range, and more than 40 dB opposite band rejection. Filter response curves are depicted in Figure 3. On board multiplexing allows using these filters for both transmitting and receiving. Active low pass filters reconstruct the time sampled output signals, characteristic of switched capacitor filters, and attenuate the unwanted energy above 15 kHz.

Duplexer: An operational amplifier is employed as an active two to four wire converter (duplexer). The two phone wires are "split" into transmit and receive components for proper processing; the transmit output from Pin 8 is applied to the lines through a resistor and the received signal is drawn from the line and routed into a preamplifier. Transmit energy appears as a common mode signal, hence does not appear on the duplexer output. The received signal, meanwhile, is amplified by two. Isolation is maximized when the transmit injection resistor (between Pins 6 and 8) is equal in magnitude to the phone line impedance (600 Ω nominal). Transmit signal levels are typically -9 dBm.

Received Carrier Amplifier: An operational amplifier, with its inverting input on Pin 20 and output on Pin 3, serves as a received carrier amplifier. Duplexer output (Pin 7) is routed to Pin 20 through a 100 k Ω or larger resistor. Gain, typically 5 (14 dB), equals the ratio of the feedback resistor (Pin 3 to Pin 20) to the input resistor (Pin 7 to Pin 20). The non-inverting input is internally biased to one half supply. The amplifier features open loop gain of 80 dB, output

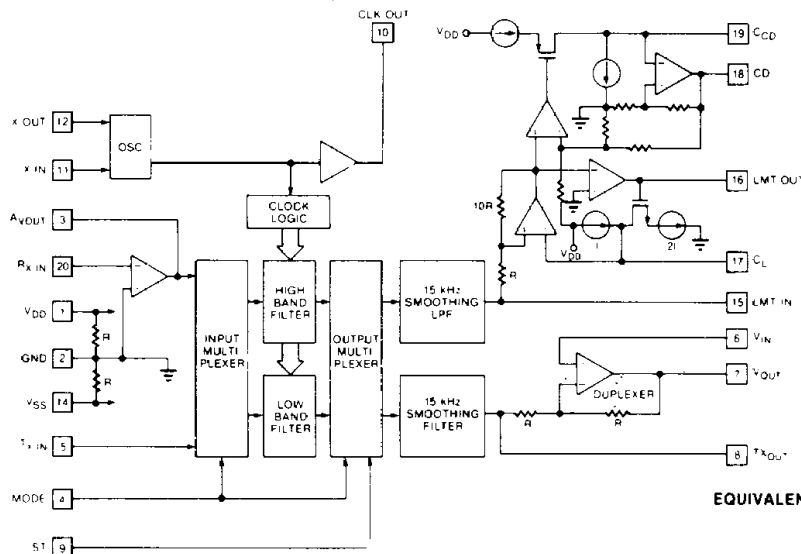

swings of 4.5 Vp-p, and a slew rate of 2V/ μ s. This pin-out allows flexible signal processing capabilities: for example, an input low pass filter for eliminating aliasing is easily achieved.

Auto-Zeroing Limiter: An automatic offset zeroing comparator (limiter) compensates for errors caused by system offset voltages and currents, and converts the received carrier into an accurate 50% duty cycle waveform. The resultant square wave on Pin 16 is at digital logic levels and can interface directly with the modulator/demodulator circuit.

Carrier Detector: An on board carrier detection circuit simplifies total system interfacing. Carrier detect output (Pin 18) pulls low when a suitable signal is received. With 14 dB of gain in the receiver preamplifier, the threshold level is -38 dBm and has 4 dB of hysteresis. Turn on/off delay time is externally programmable by a capacitor from Pin 19 to ground. A 0.1 μ F unit yields 100 ms; delay is directly proportional to capacitance.

Clocking: Filter frequency accuracy is directly related to the clock frequency. The device operates within specifications with a 1 MHz clock, provided by either a 1 MHz crystal or by sharing the 1 MHz clock signal from the XR-14412. The device will operate at other clock frequencies, but the filter center frequencies will differ. The crystal and a parallel 10 M Ω resistor are attached between Pins 11 and 12. The crystal should be series resonant with a shunt capacitance less than 9 pF. Pin 10 is the buffered clock output for interconnection with other devices.

Self Test: An on board self test diagnostic activates an analog loop-back mode: the transmit carrier is routed through the proper filter and back through the receive limiter, allowing performance verification of all systems. TX OUT and RX IN are disabled when self test is high.

XR-2103/2103A

APPLICATIONS

The Bell 103 compatible modem of Figure 5 consists of the XR-2103 FSK modem filter and the XR-14412 FSK modulator/demodulator. Designed for full duplex 300 baud operation, the circuit requires only telephone line and computer interfacing. The entire system uses a single 5V supply, and performs both answer and originate functions. Answer/Originate selection is controlled by the mode input; low input selects answer, high selects originate.

The telephone line is connected via an isolation transformer to the duplexer input (Pin 6) of the XR-2103. A resistor, equal to the line resistance, attaches from Pin 6 to the transmit output (Pin 8) and couples the transmit signal to the line. The received signal is removed from the line via the duplexer (also called a "two to four wire converter" or "hybrid"). Duplexer output is coupled through the receive carrier preamplifier into the multiplexer, where the proper band pass filter is selected. Transmit energy is seen as a common mode signal and does not appear on the duplexer output.

If the system is in the originate mode (mode pin pulled high), the received signal passes through the high band filter. Then, the sampled signal is reconstructed by an on board RC active low pass filter and is fed into the limiter and carrier detect circuit. Carrier detect output (Pin 18)

pulls low after a 100 ms delay, controlled by the 0.1 μF capacitor on the CCD pin (Pin 19). The limiter circuit compensates for circuit imperfections (offset voltages, etc.), and outputs a 50% duty cycle waveform to the demodulator input (Pin 1) of the XR-14412. The demodulated data appears on Pin 7 of the XR-14412.

Transmit data is applied to the modulator input (Pin 11) of the XR-14412. Depending on mode, answer or originate, the data modulates either the high or low band. The modulated signal exits Pin 9 and is applied to the transmit multiplexer input (Pin 5) of the XR-2103; is filtered, reconstructed, and sent into the duplexer and the phone line.

One shared time base is employed: here, the oscillator of the XR-2103 serves both devices. Buffered output is routed from Pin 10 of the XR-2103 into Pin 4 of the XR-14412.

With suitable telephone line coupling and data system interfacing, this modem realizes its goals of high performance and reliability at low cost.

With the 500 Hz filter bandwidth datarates can be achieved up to 450 BPS using the XR-2103 and XR-14412. For 600 BPS applications, the XR-1010 filter is recommended along with an external limiter.
