

## Features

- **HIGH-DENSITY PROGRAMMABLE LOGIC**
  - 256 I/O Pins
  - 12000 PLD Gates
  - 512 Registers
  - High Speed Global Interconnect
  - Wide Input Gating for Fast Counters, State Machines, Address Decoders, etc.
  - Small Logic Block Size for Random Logic
- **HIGH PERFORMANCE E<sup>2</sup>CMOS<sup>®</sup> TECHNOLOGY**
  - $f_{max} = 100$  MHz Maximum Operating Frequency
  - $t_{pd} = 10$  ns Propagation Delay
  - TTL Compatible Inputs and Outputs
  - Electrically Erasable and Reprogrammable
  - Non-Volatile
  - 100% Tested at Time of Manufacture
  - Unused Product Term Shutdown Saves Power
- **IN-SYSTEM PROGRAMMABLE**
  - 5V In-System Programmable (ISP<sup>™</sup>) using Lattice ISP or Boundary Scan Test (IEEE 1149.1) Protocol
  - Increased Manufacturing Yields, Reduced Time-to-Market, and Improved Product Quality
  - Reprogram Soldered Devices for Faster Debugging
- **100% IEEE 1149.1 BOUNDARY SCAN COMPATIBLE**
- **OFFERS THE EASE OF USE AND FAST SYSTEM SPEED OF PLDs WITH THE DENSITY AND FLEXIBILITY OF FIELD PROGRAMMABLE GATE ARRAYS**
  - Complete Programmable Device Can Combine Glue Logic and Structured Designs
  - Five Dedicated Clock Input Pins
  - Synchronous and Asynchronous Clocks
  - Programmable Output Slew Rate Control to Minimize Switching Noise
  - Flexible Pin Placement
  - Optimized Global Routing Pool Provides Global Interconnectivity
- **ispDesignEXPERT<sup>™</sup> – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
  - Superior Quality of Results
  - Tightly Integrated with Leading CAE Vendor Tools
  - Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER<sup>™</sup>
  - PC and UNIX Platforms

## Functional Block Diagram

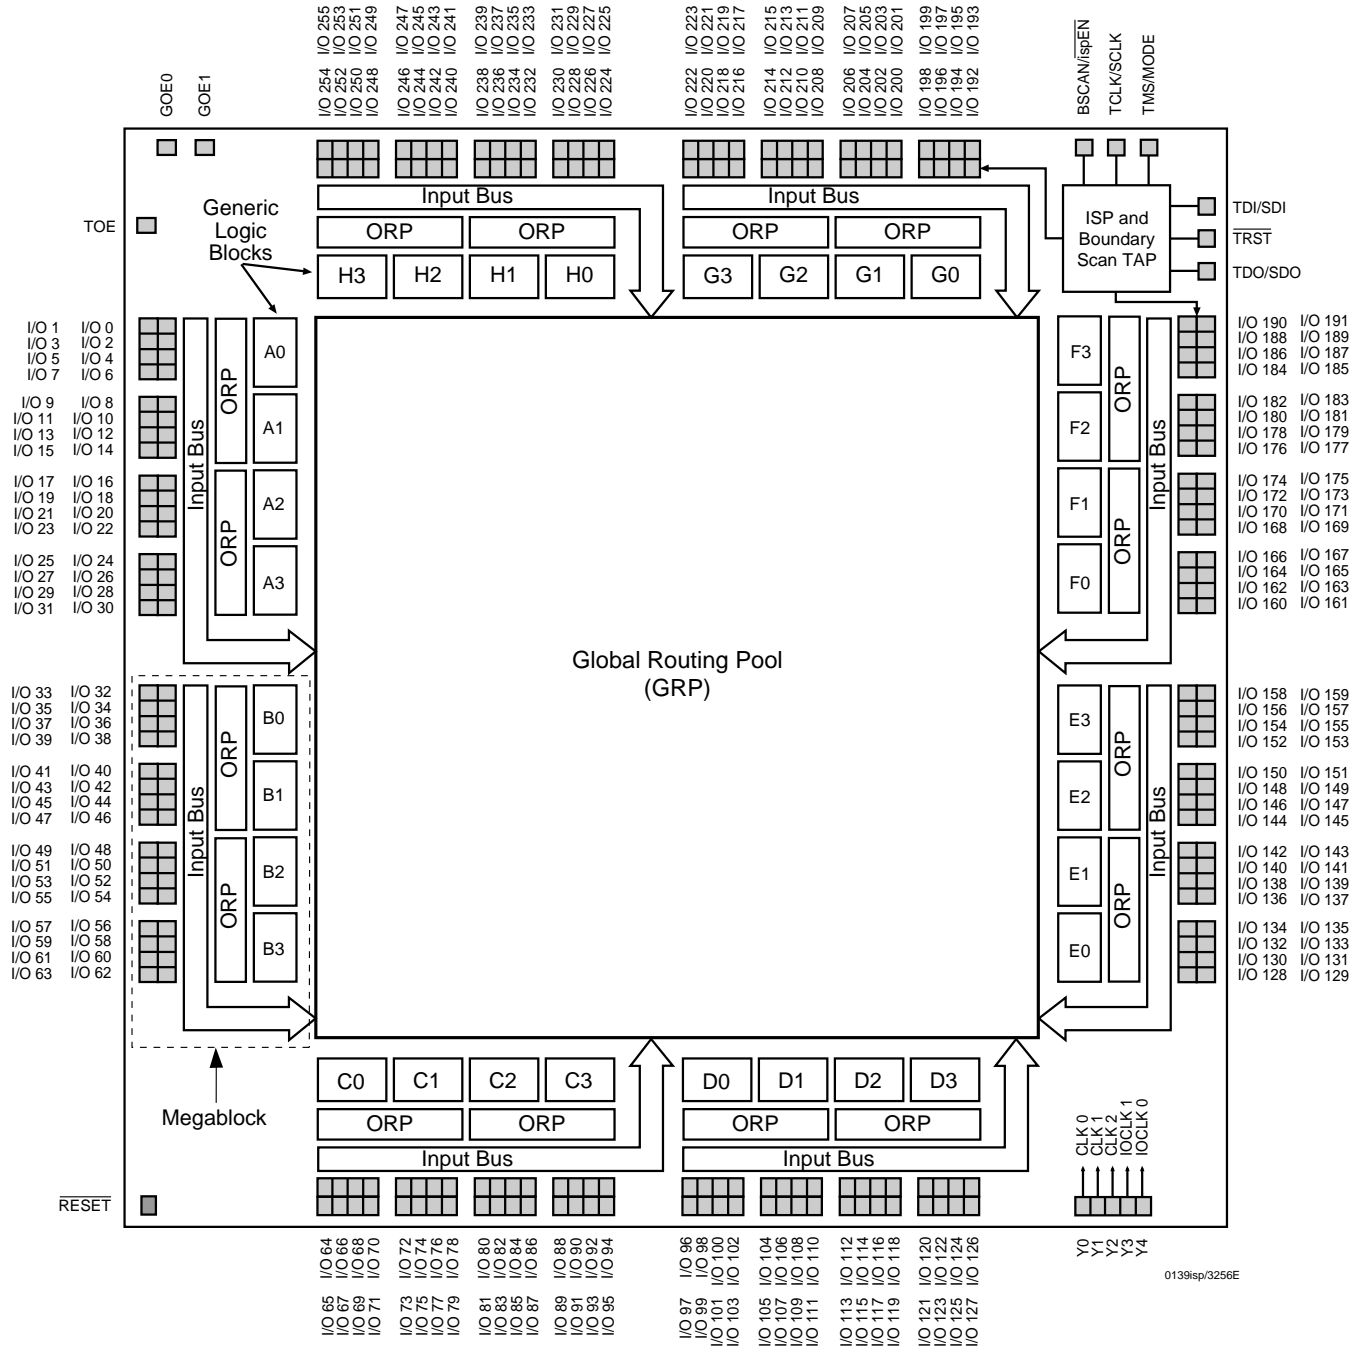

## Description

The ispLSI 3256E is a High Density Programmable Logic Device containing 512 Registers, 256 Universal I/O pins, five Dedicated Clock Input Pins, 16 Output Routing Pools (ORP) and a Global Routing Pool (GRP) which allows complete inter-connectivity between all of these elements. The ispLSI 3256E features 5V in-system programmability and in-system diagnostic capabilities. The ispLSI 3256E offers non-volatile reprogrammability of the logic, as well as the interconnect to provide truly reconfigurable systems.

The basic unit of logic on the ispLSI 3256E device is the Twin Generic Logic Block (Twin GLB) labelled A0, A1...H3. There are a total of 32 Twin GLBs in the ispLSI 3256E device. Each Twin GLB has 24 inputs, a programmable AND array and two OR/Exclusive-OR Arrays and eight outputs which can be configured to be either combinatorial or registered. All Twin GLB inputs come from the GRP.

**Functional Block Diagram**

Figure 1. ispLSI 3256E Functional Block Diagram

## Description (continued)

All local logic block outputs are brought back into the GRP so they can be connected to the inputs of any other logic block on the device. The device also has 256 I/O cells, each of which is directly connected to an I/O pin. Each I/O cell can be individually programmed to be a combinatorial input, a registered input, a latched input, an output or a bidirectional I/O pin with 3-state control. The signal levels are TTL compatible voltages and the output drivers can source 4 mA or sink 8 mA. Each output can be programmed independently for fast or slow output slew rate to minimize overall output switching noise.

The 256 I/O Cells are grouped into 16 sets of 16 bits. Pairs of these I/O groups are associated with a logic Megablock through the use of the ORP. Each Megablock is able to provide one Product Term Output Enable (PTOE) signal which is globally distributed to all I/O cells. That PTOE signal can be generated within any GLB in the Megablock. Each I/O cell can select either a Global OE or a PTOE.

Four Twin GLBs, 32 I/O Cells and two ORPs are connected together to make a logic Megablock. The Megablock is defined by the resources that it shares. The outputs of the four Twin GLBs are connected to a set of 32 I/O cells by the ORP. The ispLSI 3256E device contains eight of these Megablocks.

The GRP has as its inputs the outputs from all of the Twin GLBs and all of the inputs from the bidirectional I/O cells. All of these signals are made available to the inputs of the Twin GLBs. Delays through the GRP have been equalized to minimize timing skew and logic glitching.

Clocks in the ispLSI 3256E device are provided through five dedicated clock pins. The five pins provide three clocks to the Twin GLBs and two clocks to the I/O cells.

The table below lists key attributes of the device along with the number of resources available.

An additional feature of the ispLSI 3256E is its Boundary Scan capability, which is composed of cells connected between the on-chip system logic and the device's input and output pins. All I/O pins have associated boundary scan registers, with 3-state I/O using three boundary scan registers and inputs using one.

The ispLSI 3256E supports all IEEE 1149.1 mandatory instructions, which include BYPASS, EXTEST and SAMPLE.

## Key Attributes of the ispLSI 3256E

| Attribute            | Quantity |
|----------------------|----------|
| <b>Twin GLBs</b>     | 32       |
| <b>Registers</b>     | 512      |
| <b>I/O Pins</b>      | 256      |
| <b>Global Clocks</b> | 5        |
| <b>Global OE</b>     | 2        |
| <b>Test OE</b>       | 1        |

Table - 003/3256E

## Absolute Maximum Ratings <sup>1</sup>

|   |                         |
|---|-------------------------|
| Supply Voltage $V_{CC}$ .....   | -0.5 to +7.0V           |
| Input Voltage Applied .....   | -2.5 to $V_{CC} + 1.0V$ |
| Off-State Output Voltage Applied .....                                | -2.5 to $V_{CC} + 1.0V$ |
| Storage Temperature .....   | -65 to 150°C            |
| Case Temp. with Power Applied .....                                   | -55 to 125°C            |
| Max. Junction Temp. ( $T_J$ ) with Power Applied (304-Pin PQFP) ..... | 150°C                   |
| Max. Junction Temp. ( $T_J$ ) with Power Applied (320-Ball BGA) ..... | 140°C                   |

1. Stresses above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

## DC Recommended Operating Condition

| SYMBOL   | PARAMETER           | MIN. | MAX.         | UNITS |
|----------|---------------------|------|--------------|-------|
| $T_A$    | Ambient Temperature | 0    | 70           | °C    |
| $V_{CC}$ | Supply Voltage      | 4.75 | 5.25         | V     |
| $V_{IL}$ | Input Low Voltage   | 0    | 0.8          | V     |
| $V_{IH}$ | Input High Voltage  | 2.0  | $V_{CC} + 1$ | V     |

Table 2-0005/3256E

## Capacitance ( $T_A=25^\circ\text{C}, f=1.0\text{ MHz}$ )

| SYMBOL | PARAMETER         | TYPICAL | UNITS | TEST CONDITIONS                |
|--------|-------------------|---------|-------|--------------------------------|
| $C_1$  | I/O Capacitance   | 10      | pf    | $V_{CC} = 5.0V, V_{IO} = 2.0V$ |
| $C_2$  | Clock Capacitance | 15      | pf    | $V_{CC} = 5.0V, V_Y = 2.0V$    |

Table 2-0006/3256E

## Data Retention Specifications

| PARAMETER                     | MINIMUM | MAXIMUM | UNITS  |
|-------------------------------|---------|---------|--------|
| Data Retention                | 20      | –       | Years  |
| ispLSI Erase/Reprogram Cycles | 10000   | –       | Cycles |

Table 2-0008/3256E

**Switching Test Conditions**

|                                |                  |
|--------------------------------|------------------|
| Input Pulse Levels             | GND to 3.0V      |
| Input Rise and Fall Time       | ≤ 3ns 10% to 90% |
| Input Timing Reference Levels  | 1.5V             |
| Output Timing Reference Levels | 1.5V             |
| Output Load                    | See Figure 2     |

3-state levels are measured 0.5V from steady-state active level.

Table 2-0003/3256E

Table 2 - 0007isp/3256E

- One output at a time for a maximum duration of one second.  $V_{OUT} = 0.5V$  was selected to avoid test problems by tester ground degradation. Characterized but not 100% tested.
- Measured using sixteen 16-bit counters.
- Typical values are at  $V_{CC} = 5V$  and  $T_A = 25^\circ C$ .
- Maximum  $I_{CC}$  varies widely with specific device configuration and operating frequency. Refer to the Power Consumption section of this datasheet and Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM to estimate maximum  $I_{CC}$ .

 13.7 \text{ ns} &= (2.4 + 2.3 + 3.6) + (1.6) + (1.2 + 2.6)
 \end{aligned}$$

Table 2- 0042-3256E

Note: Calculations are based upon timing specifications for the ispLSI 3256E-100L.

## Power Consumption

Power consumption in the ispLSI 3256E device depends on two primary factors: the speed at which the device is operating and the number of product terms used.

Figure 3 shows the relationship between power and operating speed.

**Figure 3. Typical Device Power Consumption vs fmax**

Notes: Configuration of 16 16-bit Counters  
Typical Current at 5V, 25° C

ICC can be estimated for the ispLSI 3256E using the following equation:

$ICC = 60 + (\# \text{ of PTs} * 0.48) + (\# \text{ of nets} * \text{Max. freq} * 0.0106)$  where:

# of PTs = Number of Product Terms used in design

# of nets = Number of Signals used in device

Max. freq = Highest Clock Frequency to the device

The ICC estimate is based on typical conditions ( $V_{CC} = 5.0V$ , room temperature) and an assumption of two GLB loads on average exists. These values are for estimates only. Since the value of ICC is sensitive to operating conditions and the program in the device, the actual ICC should be verified.

0127/3256E

## Pin Description

| Pin Name                        | Description  |
|---------------------------------|--|
| I/O                             | Input/Output pins – These are the general purpose I/O pins used by the logic array.  |
| GOE0, GOE1                      | Global Output Enable input pins.   |
| TOE                             | Test Output Enable pin – This pin tristates all I/O pins when a logic low is driven.   |
| $\overline{\text{RESET}}$       | Active Low (0) Reset pin – Resets all of the GLB and I/O registers in the device.  |
| Y0, Y1, Y2                      | Dedicated Clock inputs. These clock inputs are connected to one of the clock inputs of all the GLBs on the device.   |
| Y3, Y4                          | Dedicated Clock inputs. These clock inputs are connected to one of the clock inputs of all the I/O cells on the device.  |
| $\overline{\text{BSCAN/ispEN}}$ | Input – Dedicated in-system programming enable input pin. When this pin is high, the BSCAN TAP controller pins TMS, TDI, TDO and TCK are enabled. When this pin is brought low, the ISP State Machine control pins MODE, SDI, SDO and SCLK are enabled. High-to-low transition of this pin will put the device in the programming mode and put all I/O pins in the high-Z state. |
| TDI/SDI                         | Input – This pin performs two functions. It is the Test Data input pin when $\overline{\text{ispEN}}$ is logic high. When $\overline{\text{ispEN}}$ is logic low, it functions as an input pin to load programming data into the device. SDI is also used as one of the two control pins for the ISP State Machine.  |
| TCK/SCLK                        | Input – This pin performs two functions. It is the Test Clock input pin when $\overline{\text{ispEN}}$ is logic high. When $\overline{\text{ispEN}}$ is logic low, it functions as a clock pin for the Serial Shift Register.  |
| TMS/MODE                        | Input – This pin performs two functions. It is the Test Mode Select input pin when $\overline{\text{ispEN}}$ is logic high. When $\overline{\text{ispEN}}$ is logic low, it functions as a pin to control the operation of the ISP State Machine.  |
| $\overline{\text{TRST/NC}}^1$   | Input – Test Reset, active low to reset the Boundary Scan State Machine.   |
| TDO/SDO                         | Output – This pin performs two functions. When $\overline{\text{ispEN}}$ is logic low, it functions as the pin to read the ISP data. When $\overline{\text{ispEN}}$ is high, it functions as Test Data Out.  |
| GND                             | Ground (GND)   |
| VCC                             | Vcc  |
| NC <sup>1</sup>                 | No Connect.  |

1. NC pins are not to be connected to any active signals, VCC or GND.
