

32K×8 CMOS SRAM (Common I/O)

FEATURES

- Organization: 32,768 words × 8 bits
- High speed
 - 10/12/15/20/25/35 ns address access time
 - 3/3/4/5/6/8 ns output enable access time
- Low power consumption
 - Active: 660 mW max (10 ns cycle)
 - Standby: 11 mW max, CMOS I/O
2.75 mW max, CMOS I/O, L version
 - Very low DC component in active power
- 2.0V data retention (L version)
- Equal access and cycle times
- Easy memory expansion with \overline{CE} and \overline{OE} inputs
- TTL-compatible, three-state I/O
- 28-pin JEDEC standard packages
 - 300 mil PDIP and SOJ
Socket compatible with 7C512 and 7C1024
 - 330 mil SOIC
 - 8×13.4 TSOP
- ESD protection > 2000 volts
- Latch-up current > 200 mA

FUNCTIONAL DESCRIPTION

The AS7C256 is a high performance CMOS 262,144-bit Static Random Access Memory (SRAM) organized as 32,768 words \times 8 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times (t_{AA} , t_{RC} , t_{WC}) of 10/12/15/20/25/35 ns with output enable access times (t_{OE}) of 3/3/4/5/6/8 ns are ideal for high performance applications. A chip enable (\overline{CE}) input permits easy memory expansion with multiple-bank memory organizations.

When \overline{CE} is HIGH the device enters standby mode. The standard AS7C256 is guaranteed not to exceed 11 mW power consumption in standby mode; the L version is guaranteed not to exceed 2.75 mW, and typically requires only 500 μ W. The L version also offers 2.0V data retention, with maximum power consumption in this mode of 300 μ W.

A write cycle is accomplished by asserting chip enable (\overline{CE}) and write enable (\overline{WE}) LOW. Data on the input pins I/O0-I/O7 is written on the rising edge of \overline{WE} (write cycle 1) or \overline{CE} (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable (\overline{OE}) or write enable (\overline{WE}).

A read cycle is accomplished by asserting chip enable (\overline{CE}) and output enable (\overline{OE}) LOW, with write enable (\overline{WE}) HIGH. The chip drives I/O pins with the data word referenced by the input address. When chip enable or output enable is HIGH, or write enable is LOW, output drivers stay in high-impedance mode.

All chip inputs and outputs are TTL-compatible, and operation is from a single 5V supply. The AS7C256 is packaged in all high volume industry standard packages.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Min	Max	Unit
Voltage on Any Pin Relative to GND	V_t	-0.5	+7.0	V
Power Dissipation	P_D	-	1.0	W

NOTE: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES

1. During V_{CC} power-up, a pull-up resistor to V_{CC} on \overline{CE} is required to meet I_{SB} specification.
2. This parameter is sampled and not 100% tested.
3. For test conditions, see AC Test Conditions, Figures A, B, C.
4. t_{CLZ} and t_{CHZ} are specified with CL = 5pF as in Figure C. Transition is measured ±500mV from steady-state voltage.
5. This parameter is guaranteed but not tested.
6. \overline{WE} is HIGH for read cycle.
7. \overline{CE} and \overline{OE} are LOW for read cycle.
8. Address valid prior to or coincident with \overline{CE} transition LOW.
9. All read cycle timings are referenced from the last valid address to the first transitioning address.
10. \overline{CE} or \overline{WE} must be HIGH during address transitions.
11. All write cycle timings are referenced from the last valid address to the first transitioning address.
