Notes:

*1. Since $P_{D(max)} = (V_{IN}-V_O) \cdot I_O = 22$(W), $V_{IN(max)}$ and $I_{O(max)}$ may be limited depending on operating conditions. Refer to the Ta—P_D curve to compute the corresponding values.

*2. Refer to the dropout voltage.

*3. IS1 rating shall be the point at which the output voltage V_O (V_{IN}=14V, I_O=0.5A) drops to –5%.

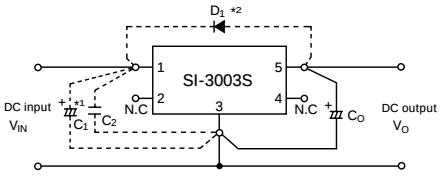
Standard Circuit Diagram



Co : Output capacitor (47 to 100μF, 50V)

*1 C_1,C_2: Anti-oscillation capacitors (C_1: approx. 47μF, C_2: approx. 0.33μF). These are required for inductive input lines or long wiring. Tantalum capacitors are recommended for C_1 and Co, especially at low temperatures.

*2 D_1 : Protection diode. Required as protection against reverse biasing between input and output. (Recommended diode: Sanken EU2Z.)

Note on Thermal Protection Characteristics:
The thermal protection circuit is intended for protection against heat during instantaneous short-circuiting. Its operation, including reliability, is not guaranteed for short-circuiting over an extended period of time.
