TWO-OUTPUT LNB SUPPLY AND CONTROL-VOLTAGE REGULATOR

Intended for analog and digital satellite receivers, the low noise block converter regulator (LNBR) is a monolithic linear and switching voltage regulator designed to provide power and interface signals to the LNB downconverter via the coaxial cable. Because most satellite receivers have two antenna ports, the output voltage of the regulator is available at one of two logic-selectable output terminals (LNBA, LNBB). If the device is in stand-by mode (EN terminal LOW), both regulator outputs are disabled, allowing the antenna downconverters to be supplied and controlled by other satellite receivers sharing the same coaxial cable. Similar single-output devices, with a bypass function for slave operation in single-dish dual-receiver systems, are the A8283SB/SLB.

The regulator outputs are set to 12, 13, 18, or 20 V by the VSEL terminals. Additionally, it is possible to increase the selected voltage by 1 V to compensate for the voltage drop in the coaxial cable (LLC terminal HIGH).

The LNBR combines a tracking switching regulator and low-noise linear regulators. Logic inputs (VSEL0, VSEL1, and LLC) select the desired output voltage. A tracking current-mode buck converter provides the linear regulator input voltage that is set to the output voltage plus typically 0.8 V. This maintains constant voltage drop across the linear regulators while permitting adequate voltage range for tone injection.

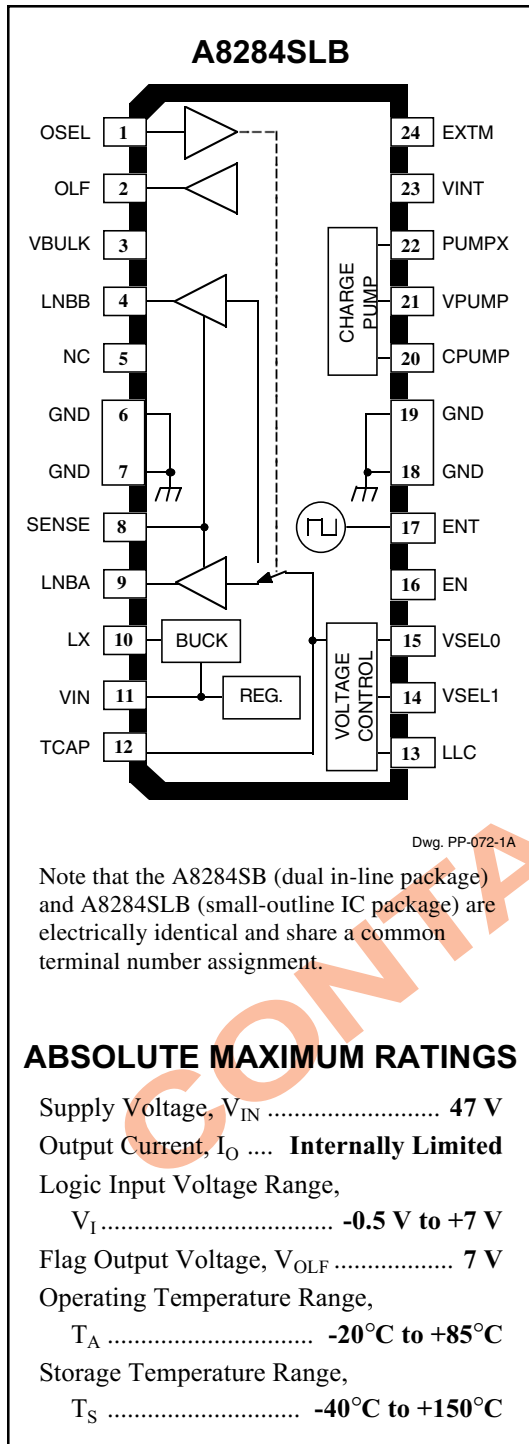

The device is supplied in a 24-pin plastic DIP with batwing tabs (A8284SB), or a 24-lead SOIC power-tab package (A8284SLB). In both cases, the power tab is at ground potential and needs no electrical isolation.

FEATURES

- Complete Interface for Two LNBs Remote Supply and Control
- LNB Selection and Stand-By Function
- Built-In Tone Oscillator Factory Trimmed to 22 kHz, Facilitates DiSEqC™ (a trademark of EUTELSAT) Encoding
- Full Modulation With No Load
- Tracking Switch-Mode Power Converter for Lowest Dissipation
- Externally Adjustable Short-Circuit Protection
- LNB Short-Circuit Protection and Diagnostics
- Auxiliary Modulation Input
- Cable Length Compensation
- Internal Over-Temperature Protection

This device incorporates features that have patents pending.

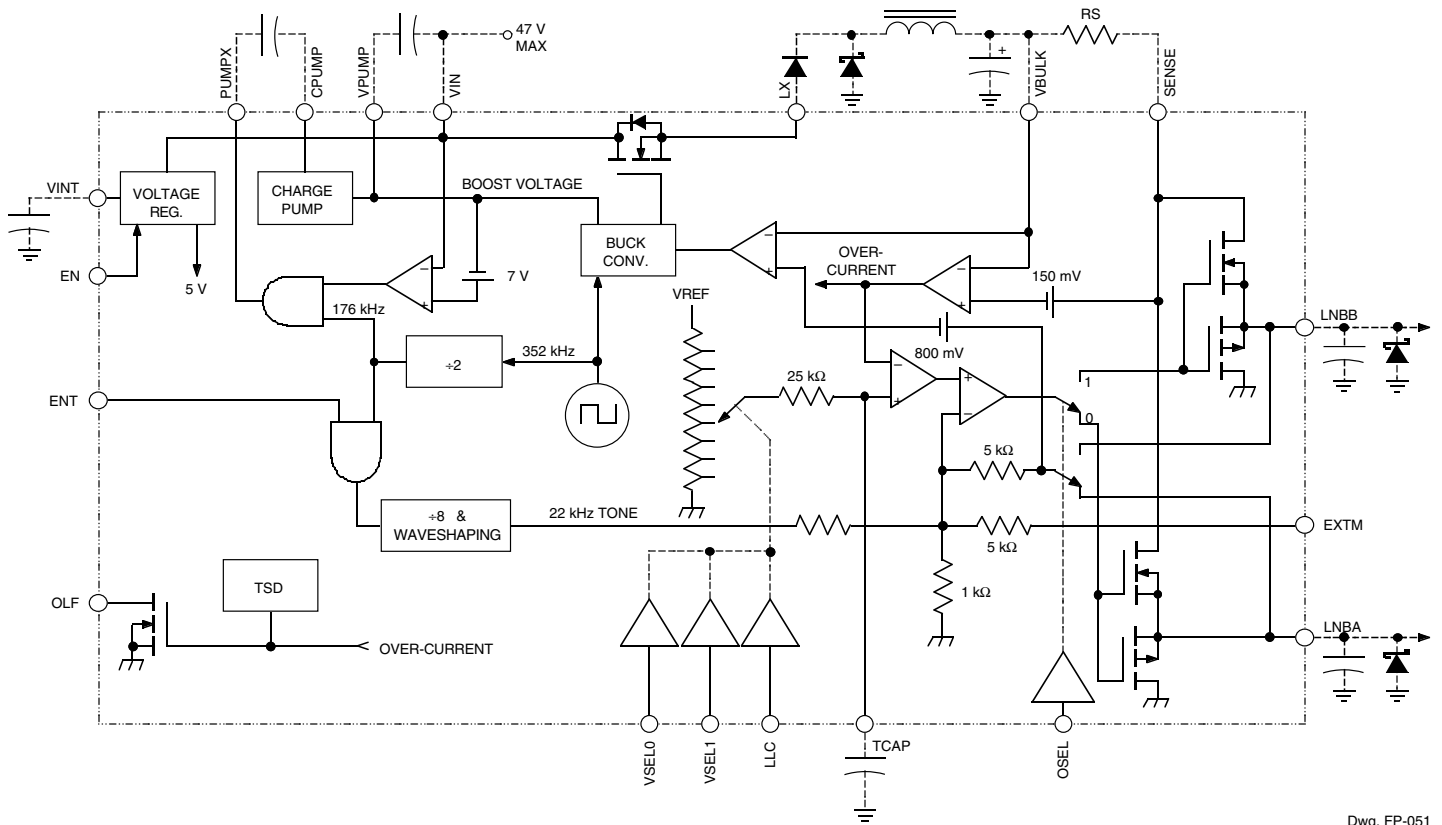

Always order by complete part number, e.g., **A8284SLB**.

FUNCTIONAL DESCRIPTION

The ENT (Tone Enable) terminal activates the internal tone signal, modulating the dc output with a ± 0.3 V, 22 kHz symmetrical waveform. The internal oscillator is factory trimmed to provide a tone of $22 \text{ kHz} \pm 2 \text{ kHz}$. No further adjustment is required. The internal oscillator operates the buck converter at 16 times the tone frequency.

Burst coding of the 22 kHz tone can be accomplished, due to the fast response of the ENT input and rapid tone response. This allows implementation of the DiSEqC™ protocols.

To improve design flexibility and to allow implementation of proposed LNB remote control standards, an analog modulation input terminal is available (EXTM). An appropriate dc blocking capacitor must be used to couple the modulating signal source to the EXTM terminal. If external modulation is not used, the EXTM terminal can be left open.

The output linear regulators will sink and source current. This feature allows full modulation capability into capacitive loads as high as $0.25 \mu\text{F}$.

The programmed output voltage rise and fall times can be set by an internal $25 \text{ k}\Omega$ resistor and an external capacitor located on the TCAP terminal. Although any value of capacitor is permitted, practical values are typically $0.001 \mu\text{F}$ to $0.02 \mu\text{F}$. This feature only affects the turn on and programmed voltage rise and fall times. Modulation is unaffected by the choice of TCAP. This terminal can be left open if voltage rise and fall time control is not required.

Two terminals are dedicated to the over-current protection/monitoring: SENSE and OLF. The LNB output is current limited. The short-circuit protection threshold is set by the value of an external resistor, R_S , between terminals 3 and 8. $R_S = V_{\text{OM(th)}}/I_{\text{OM}}$ where $V_{\text{OM(th)}}$ is the current-limiting threshold voltage and I_{OM} is the desired current limit value. The minimum recommended value for R_S is 0.17Ω .

In operation, the short-circuit protection produces current fold-back at the input due to the tracking converter. If the output is shorted the linear regulator will limit the output current to I_{OM} . The tracking converter will maintain a constant voltage drop of 0.8 V across the linear regulator. This condition results in typically 550 mW dissipation ($I_{\text{OM}} \cdot 0.8 \text{ V}$). Short-circuit or thermal shutdown activation will cause the OLF terminal, an open-drain diagnostic output flag, to go LOW.

Thermal resistance:

DIP — $R_{\theta\text{JA}} = 40^\circ\text{C/W}$, $R_{\theta\text{JT}} = 6^\circ\text{C/W}$,

SOIC — $R_{\theta\text{JA}} = 55^\circ\text{C/W}$, $R_{\theta\text{JT}} = 6^\circ\text{C/W}$.

The device junction temperature should be kept below 150°C . Thermal shut-down circuitry turns off the device if junction temperature exceeds $+165^\circ\text{C}$ typically.

The products described here are manufactured under one or more U.S. patents or U.S. patents pending.

TWO-OUTPUT LNB SUPPLY AND CONTROL-VOLTAGE REGULATOR

Terminal Configuration

Symbol	Terminal	Function
OSEL	1	Logic input: selects between LNBA (when low) and LNBB (when high)
OLF	2	Overload flag output: low when $I_O > I_{OM}$ or $T_J > 165^\circ\text{C}$, high when $I_O < I_{OM}$ and $T_J < 130^\circ\text{C}$
VBULK	3	Tracking supply voltage to linear regulators
LNBB	4	Output voltage to LNBB
NC	5	No (internal) connection
GND	6, 7	Ground
SENSE	8	Current limit setup resistor
LNBA	9	Output voltage to LNBA
LX	10	Inductor drive point
VIN	11	Supply input voltage (minimum, $V_{LNB} + 2.5\text{ V}$)
TCAP	12	Capacitor for setting the rise and fall time of the outputs
LLC	13	Logic input: when high, increases output voltage by 1 V for line length compensation
VSEL1	14	Logic input: output voltage select
VSEL0	15	Logic input: output voltage select
EN	16	Logic input: when high, enables device (LNB on)
ENT	17	Logic input: when high, enables internal 22 kHz modulation
GND	18, 19	Ground
CPUMP	20	High side of charge-pump capacitor
VPUMP	21	Gate supply voltage for high-side drivers
PUMPX	22	Charge-pump drive
VINT	23	Bypass capacitor for internal voltage reference
EXTM	24	External modulation input
