

2.5 V 184-pin Unbuffered DDR-I SDRAM Modules

512 MByte & 1024 MByte Modules PC1600, PC2100 & PC2700

Preliminary datasheet rev. 0.81

- 184-pin Unbuffered 8-Byte Dual-In-Line DDR-I SDRAM non-parity and ECC-Modules for PC and Server main memory applications
- One bank 64M x 64, 64M x 72 and two bank 128M x 64, 128M x 72 organization
- JEDEC standard Double Data Rate Synchronous DRAMs (DDR-I SDRAM) Single + 2.5 V (± 0.2 V) power supply
- Built with 512 Mbit DDR-I SDRAMs organized as 64Mb x 8 in 66-Lead TSOPII package
- Programmable $\overline{\text{CAS}}$ Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- All inputs and outputs SSTL_2 compatible
- Serial Presence Detect with E²PROM
- Jedec standard MO-206 form factor: 133.35 mm x 31.75 mm x 4.00 mm max.
- Jedec standard reference layout
- Gold plated contacts
- Performance:

The HYS64/72D64000GU and HYS64/72D128020GU are industry standard 184-pin 8-byte Dual in-line Memory Modules (DIMMs) organized as 64M x 64 and 128M x 64 for non-parity and 64M x 72 and 128M x 72 for ECC main memory applications. The memory array is designed with 512Mbit Double Data Rate Synchronous DRAMs. A variety of decoupling capacitors are mounted on the PC board. The DIMMs feature serial presence detect based on a serial E²PROM device using the 2-pin I²C protocol. The first 128 bytes are programmed with configuration data and the second 128 bytes are available to the customer.

Clock Net Wiring

Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit
		min.	max.	
Input / Output voltage relative to V_{SS}	V_{IN}, V_{OUT}	-0.5	3.6	V
Power supply voltage on V_{DD}/V_{DDQ} to V_{SS}	V_{DD}, V_{DDQ}	-0.5	3.6	V
Storage temperature range	T_{STG}	-55	+150	°C
Power dissipation (per SDRAM component)	P_D	-	1	W
Data out current (short circuit)	I_{OS}	-	50	mA

Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded.
 Functional operation should be restricted to recommended operation conditions.
 Exposure to higher than recommended voltage for extended periods of time affect device reliability

Supply Voltage Levels

Parameter	Symbol	Limit Values			Unit	Notes
		min.	nom.	max.		
Device Supply Voltage	V_{DD}	2.3	2.5	2.7	V	–
Output Supply Voltage	V_{DDQ}	2.3	2.5	2.7	V	1)
Input Reference Voltage	V_{REF}	$0.49 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	2)
Termination Voltage	V_{TT}	$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V	3)
EEPROM supply voltage	V_{DDSPD}	2.3	2.5	3.6	V	

- 1) Under all conditions, V_{DDQ} must be less than or equal to V_{DD} .
- 2) Peak to peak AC noise on V_{REF} may not exceed $\pm 2\% V_{REF(DC)}$. V_{REF} is also expected to track noise variations in V_{DDQ} .
- 3) V_{TT} of the transmitting device must track V_{REF} of the receiving device.

DC Operating Conditions (SSTL_2 Inputs)

($V_{DDQ} = 2.5 \text{ V}$, $T_A = 70 \text{ }^\circ\text{C}$, Voltage Referenced to V_{SS})

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
DC Input Logic High	$V_{IH(DC)}$	$V_{REF} + 0.15$	$V_{DDQ} + 0.3$	V	1)
DC Input Logic Low	$V_{IL(DC)}$	-0.30	$V_{REF} - 0.15$	V	–
Input Leakage Current	I_{IL}	-5	5	μA	2)
Output Leakage Current	I_{OL}	-5	5	μA	2)

- 1) The relationship between the V_{DDQ} of the driving device and the V_{REF} of the receiving device is what determines noise margins. However, in the case of $V_{IH(max)}$ (input overdrive), it is the V_{DDQ} of the receiving device that is referenced. In the case where a device is implemented such that it supports SSTL_2 inputs but has no SSTL_2 outputs (such as a translator), and therefore no V_{DDQ} supply voltage connection, inputs must tolerate input overdrive to 3.0 V (High corner $V_{DDQ} + 300 \text{ mV}$).
- 2) For any pin under test input of $0 \text{ V} \leq V_{IN} \leq V_{DDQ} + 0.3 \text{ V}$. Values are shown per DDR-SDRAM component.

1. Input slew rate ≥ 1V/ns for DDR266 and = 1V/ns for DDR200.
2. The CK/ $\overline{\text{CK}}$ input reference level (for timing reference to CK/ $\overline{\text{CK}}$) is the point at which CK and $\overline{\text{CK}}$ cross: the input reference level for signals other than CK/ $\overline{\text{CK}}$, is V_{REF}. CK/ $\overline{\text{CK}}$ slew rate are ≥ 1.0 V/ns.
3. Inputs are not recognized as valid until V_{REF} stabilizes.
4. The Output timing reference level, as measured at the timing reference point indicated in AC Characteristics (Note 3) is V_{TT}.
5. t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referred to a specific voltage level, but specify when the device is no longer driving (HZ), or begins driving (LZ).
6. The maximum limit for this parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
7. The specific requirement is that DQS be valid (HIGH, LOW, or some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from Hi-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on t_{DQSS}.
8. A maximum of eight Autorefresh commands can be posted to any given DDR SDRAM device.
9. For each of the terms, if not already an integer, round to the next highest integer. tCK is equal to the actual system clock cycle time.
10. These parameters guarantee device timing, but they are not necessarily tested on each device
11. Fast slew rate ≥ 1.0 V/ns, slow slew rate ≥ 0.5 V/ns and < 1V/ns for command/address and CK & $\overline{\text{CK}}$ slew rate > 1.0 V/ns, measured between VOH(ac) and VOL(ac)
