Document Title

1Mx36-bit, 2Mx18-bit, 4Mx9-bit QDR™ II b2 SRAM

Revision History

Rev. No.	History	Draft Date	Remark
0.0	1. Initial document.	June, 30 2001	Advance
0.1	1. Pin name change from $\overline{DLL}$ to $\overline{Doff}$. 2. Vddq range change from 1.5V to 1.5V~1.8V. 3. Update JTAG test conditions. 4. Reserved pin for high density name change from NC to Vss/SA 5. Delete AC test condition about Clock Input timing Reference Level 6. Delete clock description on page 2 and add HSTL I/O comment	Dec. 5 2001	Preliminary
0.2	1. Update current characteristics in DC electrical characteristics 2. Change AC timing characteristics 3. Update JTAG instruction coding and diagrams	July, 29. 2002	Preliminary
0.3	1. Add 4Mx9 Organization. 2. Add -FC25 part (Part Number, Idd, AC Characteristics) 3. Add AC electrical characteristics. 4. Change AC timing characteristics. 5. Change DC electrical characteristics(I_{SB1})	Sep. 6. 2002	Preliminary
0.4	1. Change the data Setup/Hold time. 2. Change the Access Time.(tCHQV, tCHQX, etc.) 3. Change the Clock Cycle Time.(MAX value of tKHKH) 4. Change the JTAG instruction coding.	Oct. 7. 2002	Preliminary
0.5	1. Change the Boundary scan exit order. 2. Change the AC timing characteristics(-25, -20) 3. Correct the Overshoot and Undershoot timing diagrams.	Dec. 16, 2002	Preliminary
0.6	1. Change the JTAG Block diagram	Dec. 26, 2002	Preliminary
0.7	1. Correct the JTAG ID register definition 2. Correct the AC timing parameter (delete the tKH$\overline{K}$H Max value) 3. Change the Isb1 current.	Mar. 20, 2003	Preliminary
0.8	1. Change the Maximum Clock cycle time. 2. Correct the 165FBGA package ball size.	April. 4, 2003	Preliminary
1.0	1. Final spec release	Oct. 31, 2003	Final
2.0	1. Delete the x8 Org. Part	Dec. 1, 2003	Final

1Mx36-bit, 2Mx18-bit, 4Mx9-bit QDR™ II b2 SRAM

FEATURES

- 1.8V+0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future freguency scaling.
- I/O Supply Voltage 1.5V+0.1V/-0.1V for 1.5V I/O, 1.8V+0.1V/-0.1V for 1.8V I/O.
- Separate independent read and write data ports with concurrent read and write operation
- HSTL I/O
- Full data coherency, providing most current data .
- Synchronous pipeline read with self timed early write.
- Registered address, control and data input/output.
- DDR(Double Data Rate) Interface on read and write ports.
- Fixed 2-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks(K and $\overline{K}$) for accurate DDR timing at clock rising edges only.
- Two input clocks for output data(C and $\overline{C}$) to minimize clock-skew and flight-time mismatches.
- Two echo clocks (CQ and $\overline{CQ}$) to enhance output data traceability.
- Single address bus.
- Byte write (x9, x18, x36) function.
- Sepatate read/write control pin($\overline{R}$ and $\overline{W}$)
- Simple depth expansion with no data contention.
- Programmable output impenance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball aray FBGA) with body size of 15x17mm

GENERAL DESCRIPTION

The K7R323682M,K7R321882M and K7R320982M are 37,748,736-bits QDR(Quad Data Rate) Synchronous Pipelined Burst SRAMs.
They are organized as 1,048,576 words by 36bits for K7R323682M, 2,097,152 words by 18 bits for K7R321882M and 4,194,304 words by 9bits for K7R320982M.

The QDR operation is possible by supporting DDR read and write operations through separate data output and input ports with the same cycle. Memory bandwidth is maxmized as data can be transfered into sram on every rising edge of K and $\overline{K}$, and transfered out of sram on every rising edge of C and $\overline{C}$.
And totally independent read and write ports eliminate the need for high speed bus turn around.

Address, data inputs, and all control signals are synchronized to the input clock (K or $\overline{K}$).
Normally data outputs are synchronized to output clocks (C and $\overline{C}$), but when C and $\overline{C}$ are tied high, the data outputs are synchronized to the input clocks (K and $\overline{K}$).
Read data are referenced to echo clock (CQ or $\overline{CQ}$) outputs.
Read address is registered on rising edges of the input K clocks, and write address is registered on rising edges of the input $\overline{K}$ clocks.
Common address bus is used to access address both for read and write operations.

The internal burst counter is fiexd to 2-bit sequential for both read and write operations.
Synchronous pipeline read and early write enable high speed operations.
Simple depth expansion is accomplished by using $\overline{R}$ and $\overline{W}$ for port selection.
Byte write operation is supported with $\overline{BW_0}$ and $\overline{BW_1}$ ($\overline{BW_2}$ and $\overline{BW_3}$) pins for x18 (x36) device and only $\overline{BW}$ pin for x9 device.
Nybble write operation is supported with $\overline{NW_0}$ and $\overline{NW_1}$ pins for x8 device.
IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoriing package pads attachment status with system.

The K7R323682M,K7R321882M and K7R320982M are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

Read Operations

Read cycles are initiated by activating $\overline{R}$ at the rising edge of the positive input clock K.
Address is presented and stored in the read address register synchronized with K clock.

For 2-bit burst DDR operation, it will access two 36-bit or 18-bit or 9-bit or 8-bit data words with each read command.
The first pipelined data is transfered out of the device triggered by $\overline{C}$ clock following next $\overline{K}$ clock rising edge.
Next burst data is triggered by the rising edge of following C clock rising edge.

Continuous read operations are initated with K clock rising edge.
And pipelined data are transferred out of device on every rising edge of both C and $\overline{C}$ clocks.
In case C and $\overline{C}$ tied to high, output data are triggered by K and $\overline{K}$ insted of C and $\overline{C}$.

When the $\overline{R}$ is disabled after a read operation, the K7R323682M,K7R321882M and K7R320982M will first complete burst read operation before entering into deselect mode at the next K clock rising edge.
Then output drivers disabled automatically to high impedance state.

Power-Up/Power-Down Supply Voltage Sequencing

The following power-up supply voltage application is recommended: V_{SS}, V_{DD}, V_{DDQ}, V_{REF}, then V_{IN}. V_{DD} and V_{DDQ} can be applied simultaneously, as long as V_{DDQ} does not exceed V_{DD} by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: V_{IN}, V_{REF}, V_{DDQ}, V_{DD}, V_{SS}. V_{DD} and V_{DDQ} can be removed simultaneously, as long as V_{DDQ} does not exceed V_{DD} by more than 0.5V during power-down.

Write Operations

Write cycles are initiated by activating $\overline{W}$ at the rising edge of the positive input clock K.
Address is presented and stored in the write address register synchronized with following $\overline{K}$ clock.

For 2-bit burst DDR operation, it will write two 36-bit or 18-bit or 9-bit or 8-bit data words with each write command.
The first "early" data is transfered and registered in to the device synchronous with same K clock rising edge with $\overline{W}$ presented.
Next burst data is transfered and registered synchronous with following $\overline{K}$ clock rising edge.

Continuous write operations are initated with K rising edge.
And "early writed" data is presented to the device on every rising edge of both K and $\overline{K}$ clocks.

When the $\overline{W}$ is disabled, the K7R323682M,K7R321882M and K7R320982M will enter into deselect mode.
The device disregards input data presented on the same cycle $\overline{W}$ disabled.

The K7R323682M, K7R321882M and K7R320982M support byte write operations.
With activating $\overline{BW_0}$ or $\overline{BW_1}$ ($\overline{BW_2}$ or $\overline{BW_3}$) in write cycle, only one byte of input data is presented.
In K7R321882M, $\overline{BW_0}$ controls write operation to D0:D8, $\overline{BW_1}$ controls write operation to D9:D17.
And in K7R323682M $\overline{BW_2}$ controls write operation to D18:D26, $\overline{BW_3}$ controls write operation to D27:D35.
And in K7R320982M $\overline{BW}$ controls write operation to D0:D8.

Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to V_{SS} through a precision resistor(RQ).
The value of RQ (within 15%) is five times the output impedance desired.

For example, 250Ω resistor will give an output impedance of 50Ω.
Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles.
In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM.

To guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

Clock Consideration

K7R323682M,K7R321882M and K7R320982M utlizes internal DLL(Delay-Locked Loops) for maximum output data valid window.
It can be placed into a stopped-clock state to minimize power with a modest restart time of 1024 clock cycles.
Circuitry automatically resets the DLL when absence of input clock is detected.

Single Clock Mode

K7R323682M,K7R321882M and K7R320982M can be operated with the single clock pair K and $\overline{K}$, insted of C or $\overline{C}$ for output clocks.
To operate these devices in single clock mode, C and $\overline{C}$ must be tied high during power up and must be maintained high during operation.
After power up, this device can' t change to or from single clock mode.
System flight time and clock skew could not be compensated in this mode.

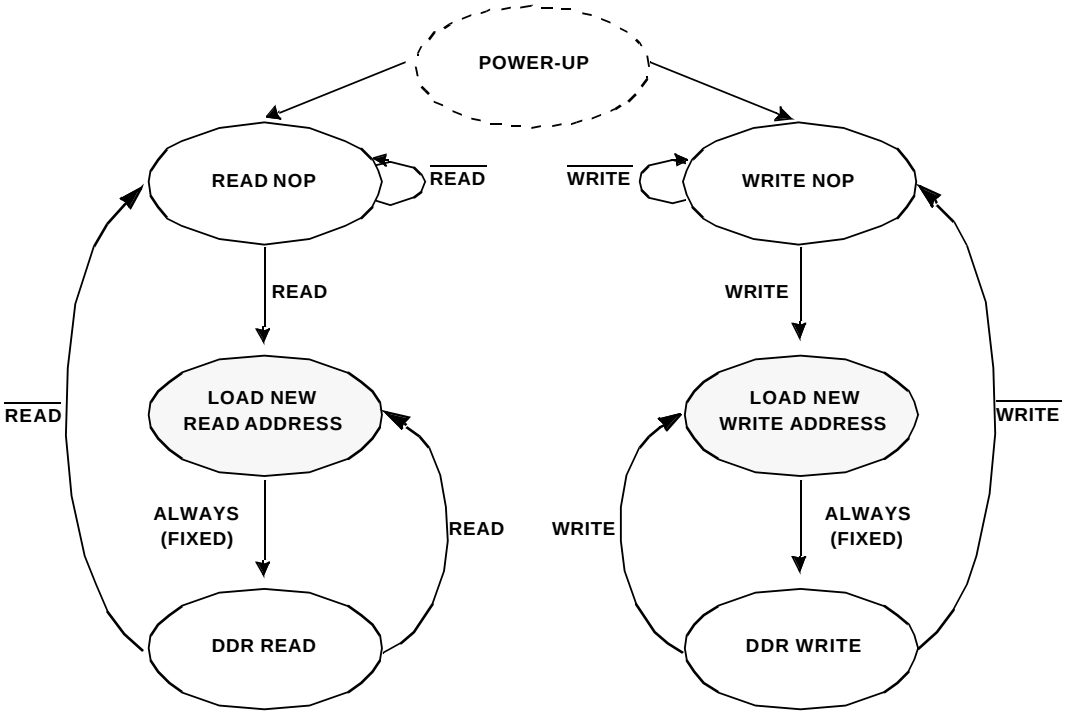
Depth Expansion

Separate input and output ports enables easy depth expansion.
Each port can be selected and deselected independently and read and write operation do not affect each other.
Before chip deselected, all read and write pending operations are completed.

Echo clock operation

To assure the output tracibility, the SRAM provides the output Echo clock, pair of compliment clock CQ and $\overline{CQ}$, which are synchronized with internal data output.
Echo clocks run free during normal operation.
The Echo clock is triggered by internal output clock signal, and transfered to external through same structures as output driver.

STATE DIAGRAM



Notes: 1. Internal burst counter is fixed as 2-bit linear, i.e. when first address is A0+0, next internal burst address is A0+1.

2. "READ" refers to read active status with $\overline{R}$=Low, "$\overline{READ}$" refers to read inactive status with $\overline{R}$=high. "WRITE" and "$\overline{WRITE}$" are the same case.

3. Read and write state machine can be active simulateneously.

4. State machine control timing sequence is controlled by K.

Storage Temperature Range Under Bias	T_{BIAS}	-10 to 85	°C

***Note:** 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

2. V_{DDQ} must not exceed V_{DD} during normal operation.

Notes: 1. Minimum cycle. I_{OUT}=0mA.

2. $|I_{OH}|$=(V_{DDQ}/2)/(RQ/5)±15% for 175Ω ≤ RQ ≤ 350Ω.
3. $|I_{OL}|$=(V_{DDQ}/2)/(RQ/5)±15% for 175Ω ≤ RQ ≤ 350Ω.
4. Minimum Impedance Mode when ZQ pin is connected to V_{DDQ}.
5. Operating current is calculated with 50% read cycles and 50% write cycles.
6. Standby Current is only after all pending read and write burst opeactions are completed.
7. Programmable Impedance Mode.
8. These are DC test criteria. DC design criteria is V_{REF}±50mV. The AC V_{IH}/V_{IL} levels are defined separately for measuring timing parameters.
9. V_{IL} (Min)DC=-0.3V, V_{IL} (Min)AC=-1.5V(pulse width ≤ 3ns).
10. V_{IH} (Max)DC=V_{DDQ}+0.3, V_{IH} (Max)AC=V_{DDQ}+0.85V(pulse width ≤ 3ns).

Notes: 1. This condition is for AC function test only, not for AC parameter test.
2. To maintain a valid level, the transitioning edge of the input must :
a) Sustain a constant slew rate from the current AC level through the target AC level, $V_{L(AC)}$ or $V_{H(AC)}$
b) Reach at least the target AC level
c) After the AC target level is reached, continue to maintain at least the target DC level, $V_{IL(DC)}$ or $V_{IH(DC)}$

Notes: 1. All address inputs must meet the specified setup and hold times for all latching clock edges.
2. Control signal are $\overline{R}$ and $\overline{W}$.
In case of BW_0,BW_1 ($\overline{BW}_2$, $\overline{BW}_3$, also for x36) signal follow the data setup/hold times.
3. If C,$\overline{C}$ are tied high, K,$\overline{K}$ become the references for C,$\overline{C}$ timing parameters.
4. To avoid bus contention, at a given voltage and temperature $tCHQX_1$ is bigger than tCHQZ.
The specs as shown do not imply bus contention beacuse $tCHQX_1$ is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than tCHQZ, which is a MAX parameter(worst case at 70°C, 1.7V)
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
6. Vdd slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once Vdd and input clock are stable.

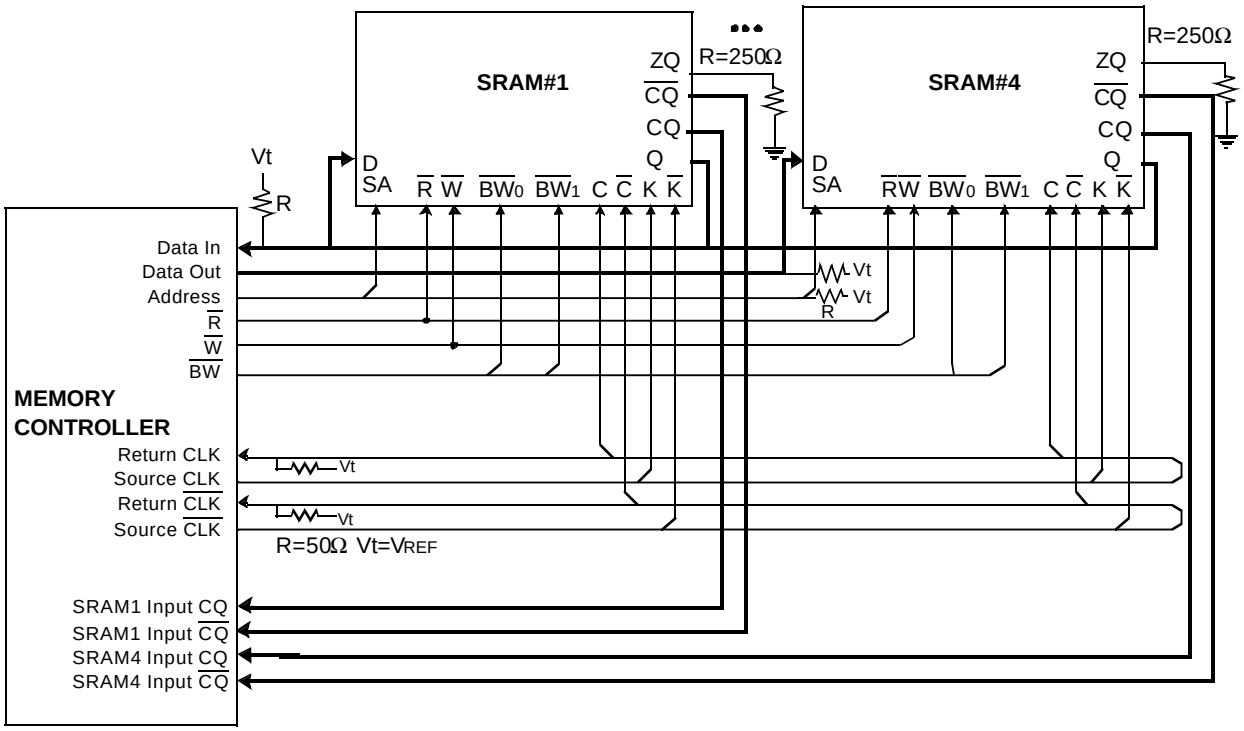
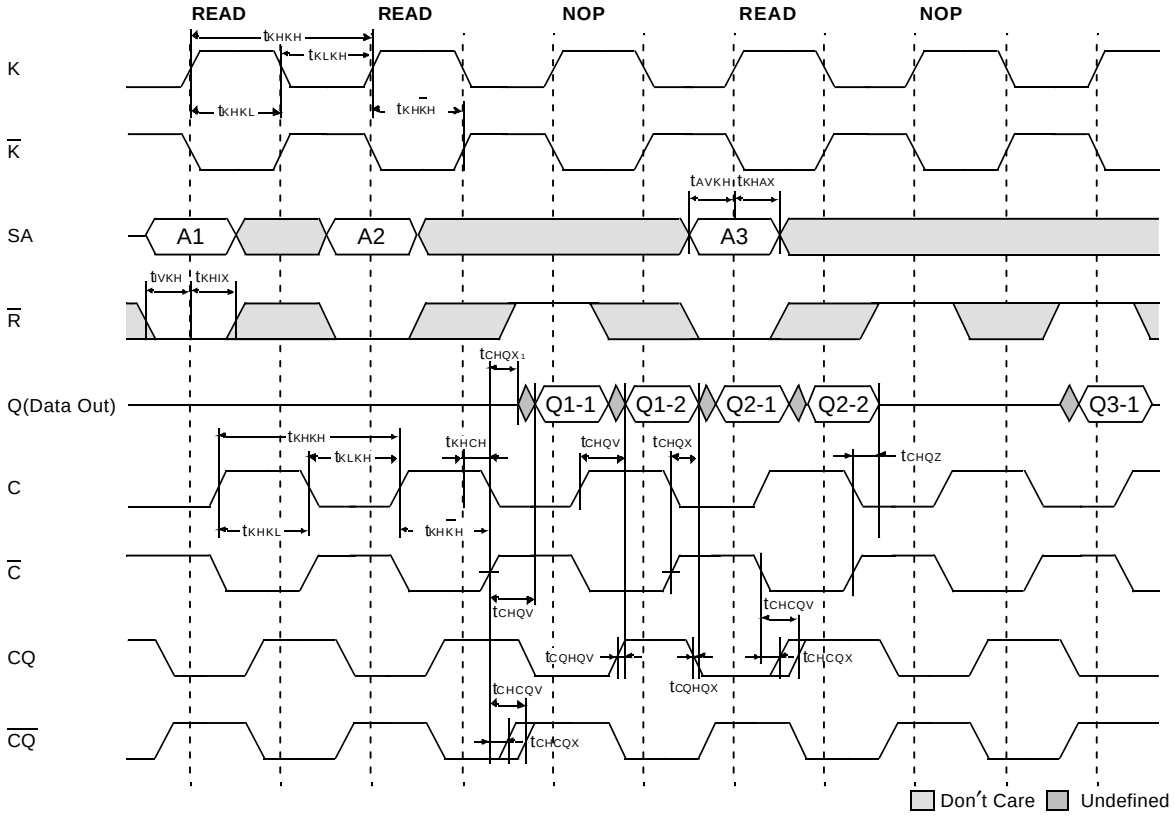
APPLICATION INRORMATION



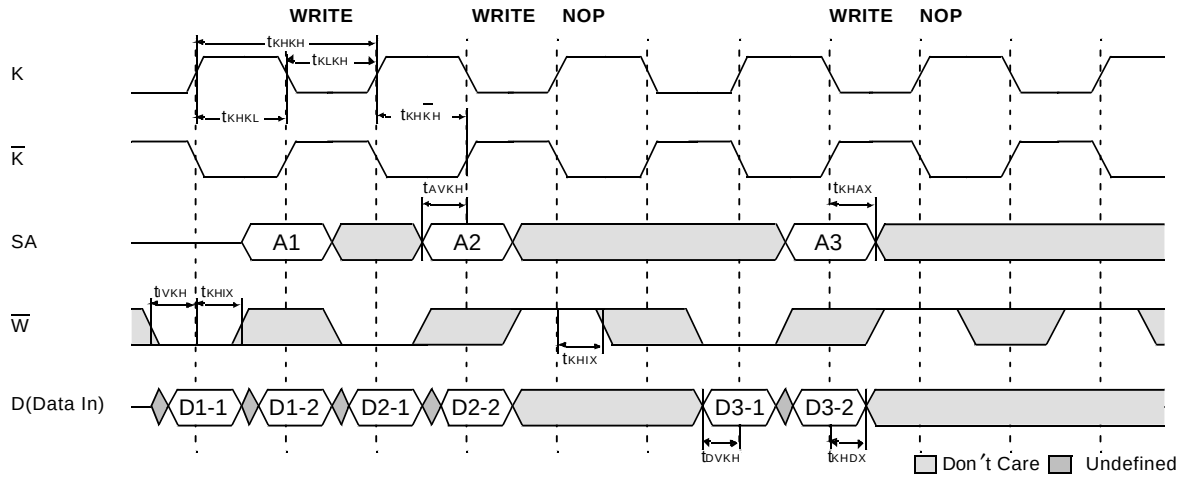
TIMING WAVE FORMS OF READ AND NOP



Note: 1. Q1-1 refers to output from address A1+0, Q1-2 refers to output from address A1+1 i.e. the next internal burst address following A1+0.

2. Outputs are disabled one cycle after a NOP.

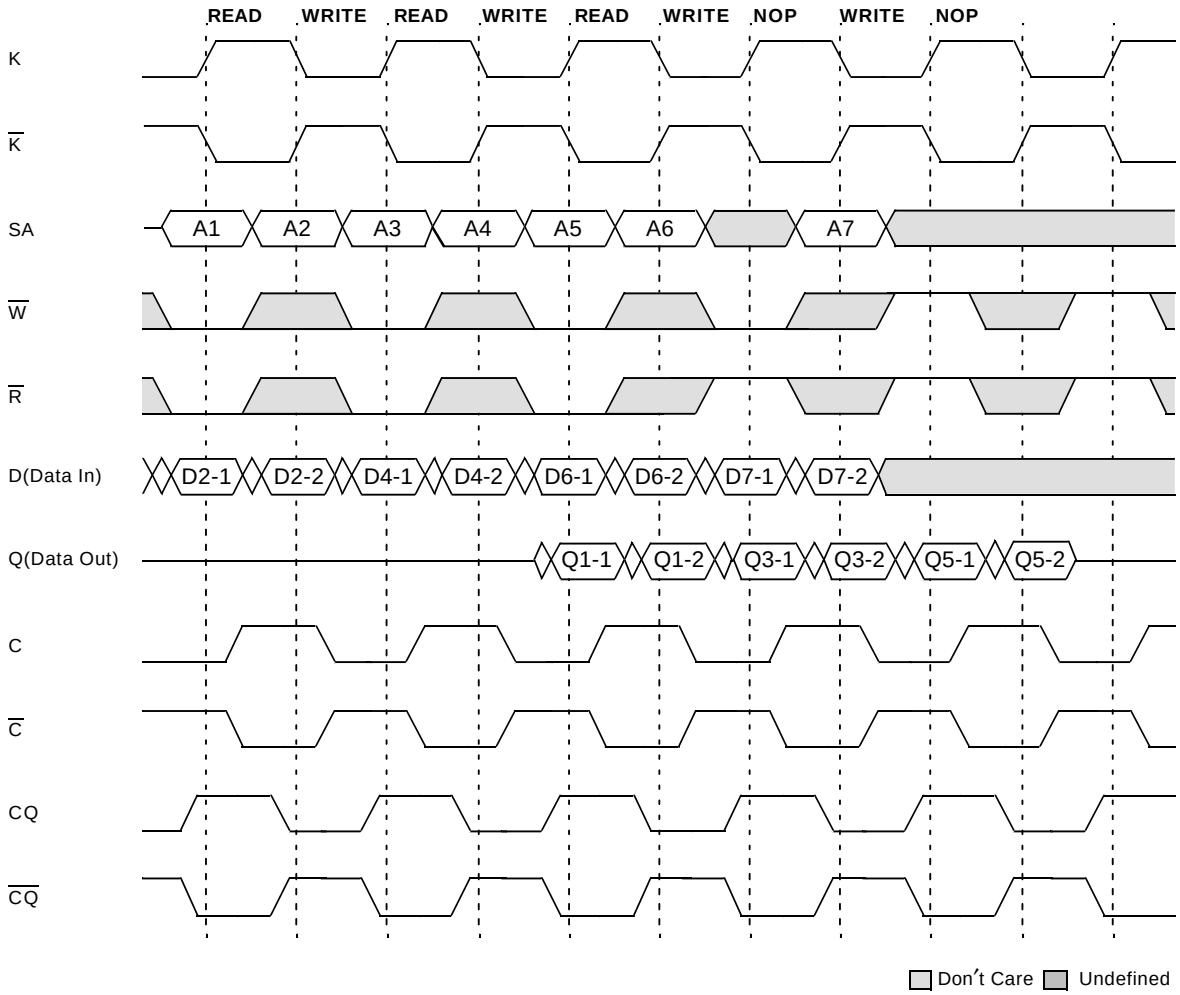
TIMING WAVE FORMS OF WRITE AND NOP



Note: 1.D1-1 refers to input to address A1+0, D1-2 refers to input to address A1+1, i.e the next internal burst address following A1+0.

2. $\overline{BWx}$ ($\overline{NWx}$) assumed active.

TIMING WAVE FORMS OF READ, WRITE AND NOP



Note: 1. If address A1=A2, data Q1-1=D2-1, data Q1-2=D2-2.
Write data is forwarded immediately as read results.
2.$\overline{BWx}$ ($\overline{NWx}$) assumed active.

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port(TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to V_{SS} to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to V_{DD} through a resistor. TDO should be left unconnected.

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to V_{SS} when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.
