

2.5V 1M x 18 Pipelined SRAM with NTD™

Features

- Organization: 1,048,576 words × 18 bits
- NTD™ architecture for efficient bus operation
- Fast clock speeds to 166 MHz
- Fast clock to data access: 3.5/3.8 ns
- Fast OE access time: 3.5/3.8 ns
- Fully synchronous operation
- Asynchronous output enable control
- Available in 100-pin TQFP package
- Individual byte write and global write
- Clock enable for operation hold
- Multiple chip enables for easy expansion
- 2.5V core power supply
- Self-timed write cycles
- Interleaved or linear burst modes
- Snooze mode for standby operation

Functional description

The AS7C251MNTD18A family is a high performance CMOS 16-Mbit synchronous Static Random Access Memory (SRAM) organized as 1,048,576 words \times 18 bits and incorporates a LATE LATE Write.

This variation of the 16Mb+ synchronous SRAM uses the No Turnaround Delay (NTD™) architecture, featuring an enhanced write operation that improves bandwidth over pipelined burst devices. In a normal pipelined burst device, the write data, command, and address are all applied to the device on the same clock edge. If a read command follows this write command, the system must wait for two 'dead' cycles for valid data to become available. These dead cycles can significantly reduce overall bandwidth for applications requiring random access or read-modify-write operations.

NTD™ devices use the memory bus more efficiently by introducing a write latency which matches the two-cycle pipelined or one-cycle flow-through read latency. Write data is applied two cycles after the write command and address, allowing the read pipeline to clear. With NTD™, write and read operations can be used in any order without producing dead bus cycles.

Assert $\overline{R\overline{W}}$ low to perform write cycles. Byte write enable controls write access to specific bytes, or can be tied low for full 18 bit writes. Write enable signals, along with the write address, are registered on a rising edge of the clock. Write data is applied to the device two clock cycles later. Unlike some asynchronous SRAMs, output enable \overline{OE} does not need to be toggled for write operations; it can be tied low for normal operations. Outputs go to a high impedance state when the device is de-selected by any of the three chip enable inputs. In pipelined mode, a two cycle deselect latency allows pending read or write operations to be completed.

Use the ADV (burst advance) input to perform burst read, write and deselect operations. When ADV is high, external addresses, chip select, $\overline{R\overline{W}}$ pins are ignored, and internal address counters increment in the count sequence specified by the \overline{LBO} control. Any device operations, including burst, can be stalled using the $\overline{CEN}=1$, the clock enable input.

The AS7C251MNTD18A operates with a $2.5V \pm 5\%$ power supply for the device core (V_{DD}). These devices are available in a 100-pin TQFP package.

TQFP capacitance

Parameter	Symbol	Test conditions	Min	Max	Unit
Input capacitance	C_{IN}^*	$V_{IN} = 0V$	-	5	pF
I/O capacitance	$C_{I/O}^*$	$V_{OUT} = 0V$	-	7	pF

* Guaranteed not tested

TQFP thermal resistance

Description	Conditions		Symbol	Typical	Units
Thermal resistance (junction to ambient) ¹	Test conditions follow standard test methods and procedures for measuring thermal impedance, per EIA/JESD51	1-layer	θ_{JA}	40	°C/W
		4-layer	θ_{JA}	22	°C/W
Thermal resistance (junction to top of case) ¹			θ_{JC}	8	°C/W

¹ This parameter is sampled

Signal descriptions

Signal	I/O	Properties	Description
CLK	I	CLOCK	Clock. All inputs except \overline{OE} , \overline{LBO} , and ZZ are synchronous to this clock.
\overline{CEN}	I	SYNC	Clock enable. When de-asserted high, the clock input signal is masked.
A, A0, A1	I	SYNC	Address. Sampled when all chip enables are active and $\overline{ADV}/\overline{LD}$ is asserted.
DQ[a,b]	I/O	SYNC	Data. Driven as output when the chip is enabled and \overline{OE} is active.
$\overline{CE0}$, CE1, CE2	I	SYNC	Synchronous chip enables. Sampled at the rising edge of CLK, when $\overline{ADV}/\overline{LD}$ is asserted. Are ignored when $\overline{ADV}/\overline{LD}$ is high.
$\overline{ADV}/\overline{LD}$	I	SYNC	Advance or Load. When sampled high, the internal burst address counter will increment in the order defined by the \overline{LBO} input value. When low, a new address is loaded.
R/ \overline{W}	I	SYNC	A high during LOAD initiates a READ operation. A low during LOAD initiates a WRITE operation. Is ignored when $\overline{ADV}/\overline{LD}$ is high.
$\overline{BW}[a,b]$	I	SYNC	Byte write enables. Used to control write on individual bytes. Sampled along with WRITE command and BURST WRITE.
\overline{OE}	I	ASYNC	Asynchronous output enable. I/O pins are not driven when \overline{OE} is inactive.
\overline{LBO}	I	STATIC	Selects Burst mode. When tied to V_{DD} or left floating, device follows interleaved Burst order. When driven Low, device follows linear Burst order. <i>This signal is internally pulled High.</i>
ZZ	I	ASYNC	Snooze. Places device in low power mode; data is retained. Connect to GND if unused.
NC	-	-	No connects.

Snooze Mode

SNOOZE MODE is a low current, power-down mode in which the device is deselected and current is reduced to I_{SB2} . The duration of SNOOZE MODE is dictated by the length of time the ZZ is in a High state.

The ZZ pin is an asynchronous, active high input that causes the device to enter SNOOZE MODE.

When the ZZ pin becomes a logic High, I_{SB2} is guaranteed after the time t_{ZZI} is met. After entering SNOOZE MODE, all inputs except ZZ is disabled and all outputs go to High-Z. Any operation pending when entering SNOOZE MODE is not guaranteed to successfully complete. Therefore, SNOOZE MODE (READ or WRITE) must not be initiated until valid pending operations are completed. Similarly, when exiting SNOOZE MODE during t_{PUS} , only a DESELECT or READ cycle should be given while the SRAM is transitioning out of SNOOZE MODE.

Burst order

Interleaved burst order ($\overline{\text{LBO}} = 1$)					Linear burst order ($\overline{\text{LBO}} = 0$)

Synchronous truth table^[5,6,7,8,9,11]

$\overline{\text{CE0}}$	CE1	$\overline{\text{CE2}}$	ADV/ $\overline{\text{LD}}$	R/ $\overline{\text{W}}$	$\overline{\text{BWn}}$	$\overline{\text{OE}}$	$\overline{\text{CEN}}$	Address source	CLK	Operation	DQ	Notes
H	X	X	L	X	X	X	L	NA	L to H	DESELECT Cycle	High-Z	
X	X	H	L	X	X	X	L	NA	L to H	DESELECT Cycle	High-Z	
X	L	X	L	X	X	X	L	NA	L to H	DESELECT Cycle	High-Z	
X	X	X	H	X	X	X	L	NA	L to H	CONTINUE DESELECT Cycle	High-Z	1
L	H	L	L	H	X	L	L	External	L to H	READ Cycle (Begin Burst)	Q	
X	X	X	H	X	X	L	L	Next	L to H	READ Cycle (Continue Burst)	Q	1,10
L	H	L	L	H	X	H	L	External	L to H	NOP/DUMMY READ (Begin Burst)	High-Z	2
X	X	X	H	X	X	H	L	Next	L to H	DUMMY READ (Continue Burst)	High-Z	1,2,10
L	H	L	L	L	L	X	L	External	L to H	WRITE CYCLE (Begin Burst)	D	3
X	X	X	H	X	L	X	L	Next	L to H	WRITE CYCLE (Continue Burst)	D	1,3,10
L	H	L	L	L	H	X	L	External	L to H	NOP/WRITE ABORT (Begin Burst)	High-Z	2,3
X	X	X	H	X	H	X	L	Next	L to H	WRITE ABORT (Continue Burst)	High-Z	1,2,3,10
X	X	X	X	X	X	X	H	Current	L to H	INHIBIT CLOCK	-	4

Key: X = Don't Care, H = HIGH, L = LOW. $\overline{\text{BWn}} = \text{H}$ means all byte write signals ($\overline{\text{BWa}}$, $\overline{\text{BWb}}$, $\overline{\text{BWc}}$, and $\overline{\text{BWd}}$) are HIGH. $\overline{\text{BWn}} = \text{L}$ means one or more byte write signals are LOW.

Notes:

1 CONTINUE BURST cycles, whether READ or WRITE, use the same control inputs. The type of cycle performed (READ or WRITE) is chosen in the initial BEGIN BURST cycle. A CONTINUE DESELECT cycle can only be entered if a DESELECT CYCLE is executed first.

2 DUMMY READ and WRITE ABORT cycles can be considered NOPs because the device performs no external operation. A WRITE ABORT means a WRITE command is given, but no operation is performed.

3 $\overline{\text{OE}}$ may be wired LOW to minimize the number of control signals to the SRAM. The device will automatically turn off the output drivers during a WRITE cycle. $\overline{\text{OE}}$ may be used when the bus turn-on and turn-off times do not meet an application's requirements.

4 If an INHIBIT CLOCK command occurs during a READ operation, the DQ bus will remain active (Low-Z). If it occurs during a WRITE cycle, the bus will remain in High-Z. No WRITE operations will be performed during the INHIBIT CLOCK cycle.

5 $\overline{\text{BWa}}$ enables WRITES to byte "a" (DQa pins); $\overline{\text{BWb}}$ enables WRITES to byte "b" (DQb pins); $\overline{\text{BWc}}$ enables WRITES to byte "c" (DQc pins); $\overline{\text{BWd}}$ enables WRITES to byte "d" (DQd pins).

6 All inputs except $\overline{\text{OE}}$ and ZZ must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.

7 Wait states are inserted by setting $\overline{\text{CEN}}$ HIGH.

8 This device contains circuitry that will ensure that the outputs will be in High-Z during power-up.

9 The device incorporates a 2-bit burst counter. Address wraps to the initial address every fourth BURST CYCLE.

10 The address counter is incremented for all CONTINUE BURST cycles.

11 ZZ pin is always Low in this truth table.

State diagram for NTD SRAM

Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Power supply voltage relative to GND	V_{DD}, V_{DDQ}	-0.3	+3.6	V
Input voltage relative to GND (input pins)	V_{IN}	-0.3	$V_{DD} + 0.3$	V
Input voltage relative to GND (I/O pins)	V_{IN}	-0.3	$V_{DDQ} + 0.3$	V
Power dissipation	P_D	-	1.8	W
DC output current	I_{OUT}	-	50	mA
Storage temperature	T_{stg}	-65	+150	°C
Temperature under bias (junction)	T_{bias}	-65	+150	°C

Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect reliability.

Recommended operating conditions

Parameter	Symbol	Min	Nominal	Max	Unit
Supply voltage for inputs	V_{DD}	2.375	2.5	2.625	V
Supply voltage for I/O	V_{DDQ}	2.375	2.5	2.625	V
Ground supply	V_{SS}	0	0	0	V

DC electrical characteristics

Parameter	Sym	Conditions	Min	Max	Unit
Input leakage current [†]	$ I_{LI} $	$V_{DD} = \text{Max}, 0V \leq V_{IN} \leq V_{DD}$	-2	2	μA
Output leakage current	$ I_{LO} $	$OE \geq V_{IH}, V_{DD} = \text{Max}, 0V \leq V_{OUT} \leq V_{DDQ}$	-2	2	μA
Input high (logic 1) voltage	V_{IH}	Address and control pins	1.7*	$V_{DD}+0.3$	V
		I/O pins	1.7*	$V_{DDQ}+0.3$	V
Input low (logic 0) voltage	V_{IL}	Address and control pins	-0.3**	0.7	V
		I/O pins	-0.3**	0.7	V
Output high voltage	V_{OH}	$I_{OH} = -4 \text{ mA}, V_{DDQ} = 2.375\text{V}$	1.7	-	V
Output low voltage	V_{OL}	$I_{OL} = 8 \text{ mA}, V_{DDQ} = 2.625\text{V}$	-	0.7	V

[†] LBO and ZZ pins have an internal pull-up or pull-down, and input leakage = $\pm 10 \mu\text{A}$.

* $V_{IH \text{ max}} < V_{DD} + 1.5\text{V}$ for pulse width less than $0.2 \times t_{CYC}$

** $V_{IL \text{ min}} = -1.5$ for pulse width less than $0.2 \times t_{CYC}$

I_{DD} operating conditions and maximum limits

Parameter	Sym	Conditions	-166	-133	Unit
Operating power supply current ¹	I_{CC}	$\overline{CE0} \leq V_{IL}, CE1 \geq V_{IH}, \overline{CE2} \leq V_{IL}, f = f_{Max},$ $I_{OUT} = 0 \text{ mA}, ZZ \leq V_{IL}$	290	270	mA
Standby power supply current	I_{SB}	All $V_{IN} \leq 0.2\text{V}$ or $\geq V_{DD} - 0.2\text{V}$, Deselected, $f = f_{Max}, ZZ \leq V_{IL}$	85	75	mA
	I_{SB1}	Deselected, $f = 0, ZZ \leq 0.2\text{V}$, all $V_{IN} \leq 0.2\text{V}$ or $\geq V_{DD} - 0.2\text{V}$	40	40	
	I_{SB2}	Deselected, $f = f_{Max}, ZZ \geq V_{DD} - 0.2\text{V}$, all $V_{IN} \leq V_{IL}$ or $\geq V_{IH}$	40	40	

¹ I_{CC} given with no output loading. I_{CC} increases with faster cycle times and greater output loading.

Key to switching waveforms

Timing waveform of read cycle

Timing waveform of write cycle

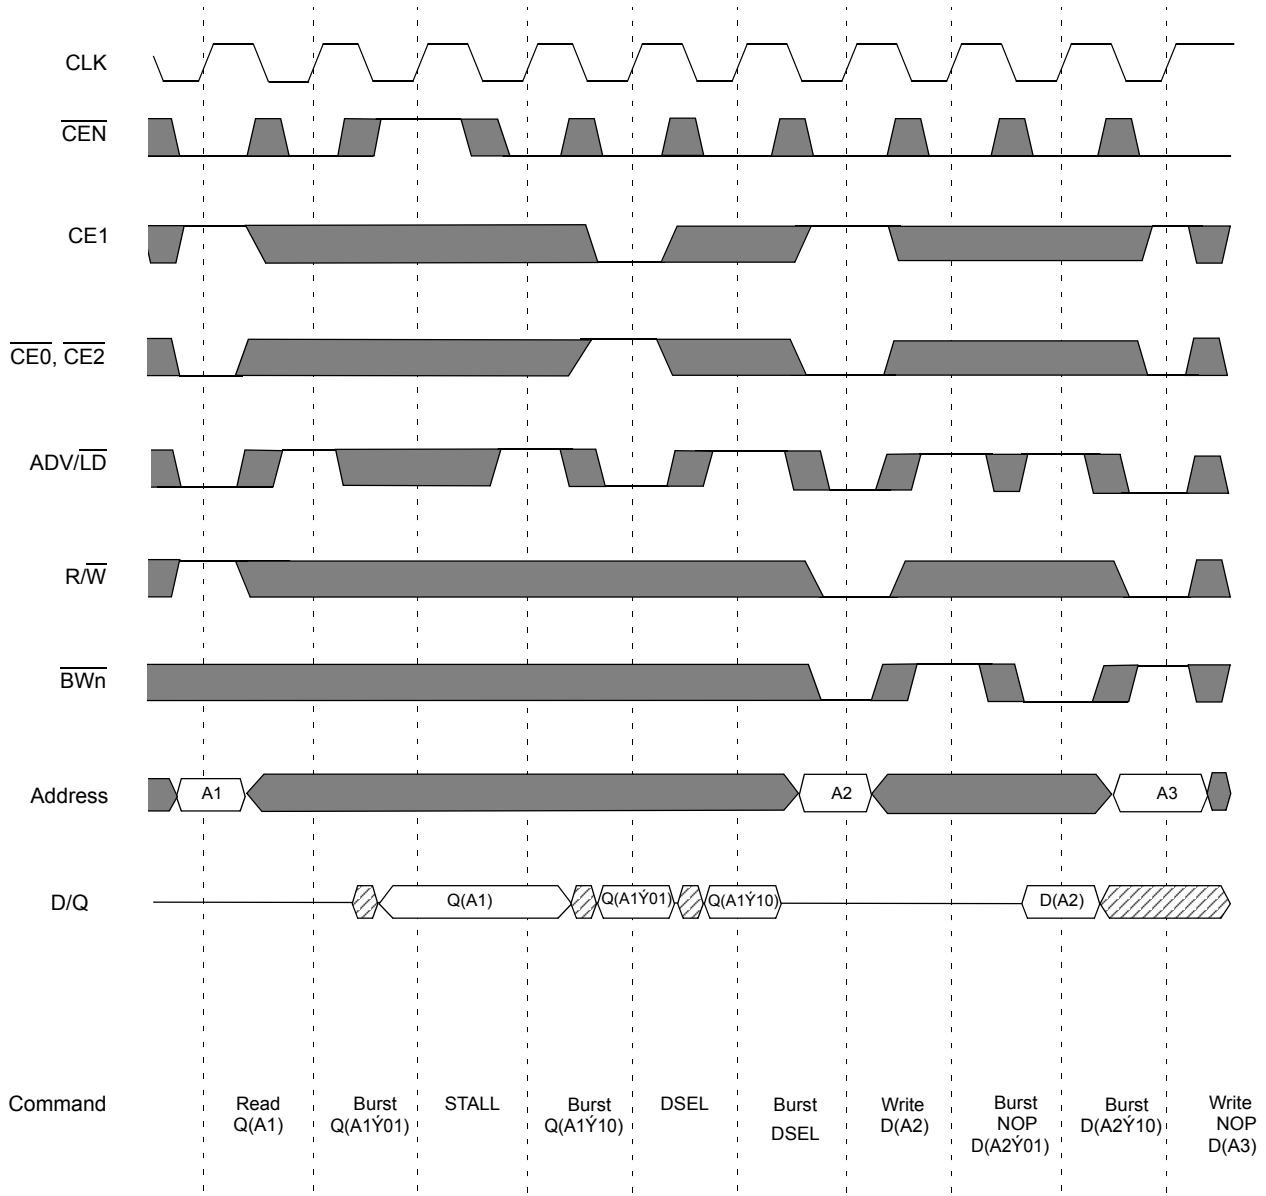

Timing waveform of read/write cycle

Note: \dot{Y} = XOR when \overline{LBO} = high/no connect. \dot{Y} = ADD when \overline{LBO} = low. $\overline{BW[a:d]}$ is don't care.

NOP, stall and deselect cycles

Note: \dot{Y} = XOR when \overline{LBO} = high/no connect; \dot{Y} = ADD when \overline{LBO} = low. \overline{OE} is low.

Timing waveform of snooze mode

AC test conditions

- Output load: see Figure B, except for t_{LZC} , t_{LZOE} , t_{HZOE} , t_{HZC} , see Figure C.
- Input pulse level: GND to 2.5V. See Figure A.
- Input rise and fall time (measured at 0.25V and 2.25V): 2 ns. See Figure A.
- Input and output timing reference levels: 1.25V.

Figure A: Input waveform

Figure B: Output load (A)

Thevenin equivalent:

Figure C: Output load(B)

Notes:

- 1) For test conditions, see “AC test conditions”, Figures A, B, C
- 2) This parameter measured with output load condition in Figure C.
- 3) This parameter is sampled, but not 100% tested.
- 4) t_{HZOE} is less than t_{LZOE} and t_{HZC} is less than t_{LZC} at any given temperature and voltage.
- 5) t_{CH} measured high above V_{IH} and t_{CL} measured as low below V_{IL}
- 6) This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of CLK when chip is enabled.
- 7) Write refers to $\overline{R/W}$ and $\overline{BW[a,b]}$.
- 8) Chip select refers to $\overline{CE0}$, CE1, and $\overline{CE2}$.
