

## Versa 8051 MCU with 64KB of IAP/ISP Flash

### Overview

The VRS51C1000 is based on the standard 8051 microcontroller family architecture and is pin compatible and a drop-in replacement for most 8051 MCUs.

The VRS51C1000 is ideal for a range of applications requiring a large amount of program/data memory with non-volatile data storage and/or code/field based firmware upgrade capability coupled with comprehensive peripheral support. It features 64KB of In-System/In-Application Programmable Flash memory, 1KB of SRAM, 5 PWM output channels, a UART, three 16-bit timers, a Watchdog timer and power down features.

The VRS51C1000 is available with firmware that enables In-System Programming (firmware based boot-loader) of the Flash memory via the UART interface (ISPvX version). General Flash memory programming is supported by device programmers available from Ramtron or other 3rd party suppliers.

The device also includes a fifth, 4-bit, I/O port mapped into the "no connect" pins of the standard 8051/52 package, providing a total of 36 I/Os while maintaining compatibility with standard 8051/82 pin outs.

The VRS51C1000 is available in PLCC-44, QFP-44 and DIP-40 packages and function over the industrial temperature range.

### Feature Set

- 8051/8052 pin compatible
- 64KB Flash memory
- In-System / In-Application Flash Programming (ISP/IAP)
- Program voltage: 5V
- 1024 Bytes on chip data SRAM
- Four 8-bit I/Os + one 4-bit I/O
- 5 PWM outputs on P1.3 to P1.7
- One Full Duplex UART serial port
- Three 16-bit Timers/Counters
- Watchdog Timer
- Bit operation instruction
- 8-bit Unsigned Multiply and Division instructions
- BCD arithmetic
- Direct and Indirect Addressing
- Two Levels of Interrupt Priority and Nested Interrupts
- Power saving modes
- Code protection function
- Low EMI (inhibit ALE)
- Operating Temperature Range -40°C to +85°C

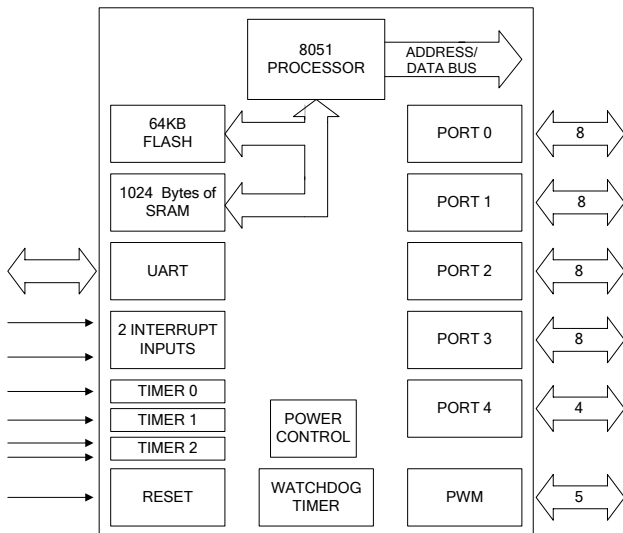

FIGURE 1: VRS51C1000 FUNCTIONAL DIAGRAM

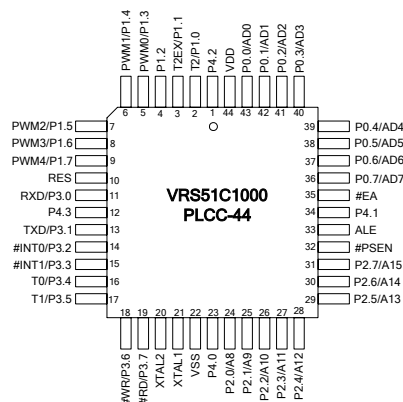

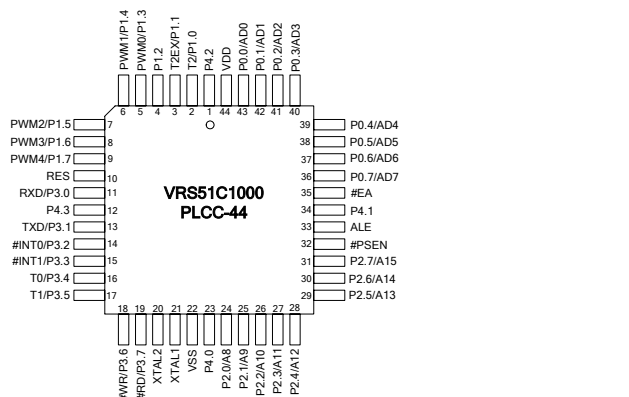

## Pin Descriptions for QFP-44/PLCC-44

TABLE 1: PIN DESCRIPTIONS FOR QFP-44/PLCC-44

QFP - 44	PLCC - 44	Name	I/O	Function
1	7	PWM2	O	PWM Channel 2
		P1.5	I/O	Bit 5 of Port 1
2	8	PWM3	O	PWM Channel 3
		P1.6	I/O	Bit 6 of Port 1
3	9	PWM4	O	PWM Channel 4
		P1.7	I/O	Bit 7 of Port 1
4	10	RES	I	Reset
		RXD	I	Receive Data
5	11	P3.0	I/O	Bit 0 of Port 3
		P4.3	I/O	Bit 3 of Port 4
6	12	TXD	O	Transmit Data &
		P3.1	I/O	Bit 1 of Port 3
8	14	#INT0	I	External Interrupt 0
		P3.2	I/O	Bit 2 of Port 3
9	15	#INT1	I	External Interrupt 1
		P3.3	I/O	Bit 3 of Port 3
10	16	T0	I	Timer 0
		P3.4	I/O	Bit 4 of Port 3
11	17	T1	I	Timer 1 & 3
		P3.5	I/O	Bit 5 of Port
12	18	#WR	O	Ext. Memory Write
		P3.6	I/O	Bit 6 of Port 3
13	19	#RD	O	Ext. Memory Read
		P3.7	I/O	Bit 7 of Port 3
14	20	XTAL2	O	Oscillator/Crystal Output
15	21	XTAL1	I	Oscillator/Crystal In
16	22	VSS	-	Ground
17	23	P4.0	I/O	Bit 0 of Port 4
		P2.0	I/O	Bit 0 of Port 2
18	24	A8	O	Bit 8 of External Memory Address
		P2.1	I/O	Bit 1 of Port 2
19	25	A9	O	Bit 9 of External Memory Address
		P2.2	I/O	Bit 2 of Port 2
20	26	A10	O	Bit 10 of External Memory Address
		P2.3	I/O	Bit 3 of Port 2 &
21	27	A11	O	Bit 11 of External Memory Address
		P2.4	I/O	Bit 4 of Port 2
22	28	A12	O	Bit 12 of External Memory Address
		P2.5	I/O	Bit 5 of Port 2
23	29	A13	O	Bit 13 of External Memory Address

QFP - 44	PLCC - 44	Name	I/O	Function
24	30	P2.6	I/O	Bit 6 of Port 2
		A14	O	Bit 14 of External Memory Address
25	31	P2.7	I/O	Bit 7 of Port 2
		A15	O	Bit 15 of External Memory Address
26	32	#PSEN	O	Program Store Enable
27	33	ALE	O	Address Latch Enable
28	34	P4.1	I/O	Bit 1 of Port 4
29	35	#EA	I	External Access
30	36	P0.7	I/O	Bit 7 Of Port 0
		AD7	I/O	Data/Address Bit 7 of External Memory
31	37	P0.6	I/O	Bit 6 of Port 0
		AD6	I/O	Data/Address Bit 6 of External Memory
32	38	P0.5	I/O	Bit 5 of Port 0
		AD5	I/O	Data/Address Bit 5 of External Memory
33	39	P0.4	I/O	Bit 4 of Port 0
		AD4	I/O	Data/Address Bit 4 of External Memory
34	40	P0.3	I/O	Bit 3 Of Port 0
		AD3	I/O	Data/Address Bit 3 of External Memory
35	41	P0.2	I/O	Bit 2 of Port 0
		AD2	I/O	Data/Address Bit 2 of External Memory
36	42	P0.1	I/O	Bit 1 of Port 0 & Data
		AD1	I/O	Address Bit 1 of External Memory
37	43	P0.0	I/O	Bit 0 Of Port 0 & Data
		AD0	I/O	Address Bit 0 of External Memory
38	44	VDD	-	VCC
39	1	P4.2	I/O	Bit 2 of Port 4
		T2	I	Timer 2 Clock Out
40	2	P1.0	I/O	Bit 0 of Port 1
		T2EX	I	Timer 2 Control
41	3	P1.1	I/O	Bit 1 of Port 1
		P1.2	I/O	Bit 2 of Port 1
42	4	P1.3	I/O	Bit 3 of Port 1
		PWM0	O	PWM Channel 0
43	5	P1.4	I/O	Bit 4 of Port 1
		PWM1	O	PWM Channel 1
44	6	P1.5	I/O	Bit 5 of Port 1

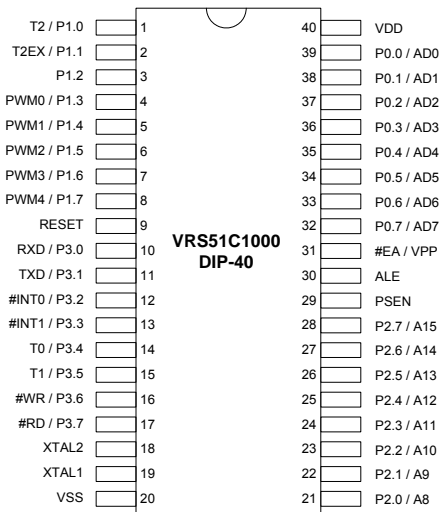

## VRS51C1000 DIP-40 Pin Descriptions

TABLE 2: VRS51C1000 PIN DESCRIPTIONS FOR DIP40 PACKAGE

DIP40	Name	I/O	Function
1	T2	I	Timer 2 Clock Out
	P1.0	I/O	Bit 0 of Port 1
2	T2EX	I	Timer 2 Control
	P1.1	I/O	Bit 1 of Port 1
3	P1.2	I/O	Bit 2 of Port 1
4	PWM0	O	PWM Channel 0
	P1.3	I/O	Bit 3 of Port 1
5	PWM1	O	PWM Channel 1
	P1.4	I/O	Bit 4 of Port 1
6	PWM2	O	PWM Channel 2
	P1.5	I/O	Bit 5 of Port 1
7	PWM3	O	PWM Channel 3
	P1.6	I/O	Bit 6 of Port 1
8	PWM4	O	PWM Channel 4
	P1.7	I/O	Bit 7 of Port 1
9	RESET	I	Reset
10	RXD	I	Receive Data
	P3.0	I/O	Bit 0 of Port 3
11	TXD	O	Transmit Data &
	P3.1	I/O	Bit 1 of Port 3
12	#INT0	I	External Interrupt 0
	P3.2	I/O	Bit 2 of Port 3
13	#INT1	I	External Interrupt 1
	P3.3	I/O	Bit 3 of Port 3
14	T0	I	Timer 0
	P3.4	I/O	Bit 4 of Port 3
15	T1	I	Timer 1 & 3
	P3.5	I/O	Bit 5 of Port
16	#WR	O	Ext. Memory Write
	P3.6	I/O	Bit 6 of Port 3
17	#RD	O	Ext. Memory Read
	P3.7	I/O	Bit 7 of Port 3
18	XTAL2	O	Oscillator/Crystal Output
19	XTAL1	I	Oscillator/Crystal In
20	VSS	-	Ground

DIP40	Name	I/O	Function
21	P2.0	I/O	Bit 0 of Port 2
	A8	O	Bit 8 of External Memory Address
22	P2.1	I/O	Bit 1 of Port 2
	A9	O	Bit 9 of External Memory Address
23	P2.2	I/O	Bit 2 of Port 2
	A10	O	Bit 10 of External Memory Address
24	P2.3	I/O	Bit 3 of Port 2 &
	A11	O	Bit 11 of External Memory Address
25	P2.4	I/O	Bit 4 of Port 2
	A12	O	Bit 12 of External Memory Address
26	P2.5	I/O	Bit 5 of Port 2
	A13	O	Bit 13 of External Memory Address
27	P2.6	I/O	Bit 6 of Port 2
	A14	O	Bit 14 of External Memory Address
28	P2.7	I/O	Bit 7 of Port 2
	A15	O	Bit 15 of External Memory Address
29	#PSEN	O	Program Store Enable
30	ALE	O	Address Latch Enable
31	#EA / VPP	I	External Access Flash programming voltage input
	P0.7	I/O	Bit 7 Of Port 0
32	AD7	I/O	Data/Address Bit 7 of External Memory
	P0.6	I/O	Bit 6 of Port 0
33	AD6	I/O	Data/Address Bit 6 of External Memory
	P0.5	I/O	Bit 5 of Port 0
34	AD5	I/O	Data/Address Bit 5 of External Memory
	P0.4	I/O	Bit 4 of Port 0
35	AD4	I/O	Data/Address Bit 4 of External Memory
	P0.3	I/O	Bit 3 Of Port 0
36	AD3	I/O	Data/Address Bit 3 of External Memory
	P0.2	I/O	Bit 2 of Port 0
37	AD2	I/O	Data/Address Bit 2 of External Memory
	P0. 1	I/O	Bit 1 of Port 0 & Data
38	AD1	I/O	Address Bit 1 of External Memory
	P0.0	I/O	Bit 0 Of Port 0 & Data
39	AD0	I/O	Address Bit 0 of External Memory
	VDD	-	Supply input

## Instruction Set

The following table describes the instruction set of the VRS51C1000. The instructions are function and binary code compatible with industry standard 8051s.

Table 3: Legend for Instruction Set Table

Symbol	Function
A	Accumulator
Rn	Register R0-R7
Direct	Internal register address
@Ri	Internal register pointed to by R0 or R1 (except MOVX)
rel	Two's complement offset byte
bit	Direct bit address
#data	8-bit constant
#data 16	16-bit constant
addr 16	16-bit destination address
addr 11	11-bit destination address

TABLE 4: VRS51C1000 INSTRUCTION SET

Mnemonic	Description	Size (bytes)	Instr. Cycles
<b>Arithmetic Instructions</b>			
ADD A, Rn	Add register to A	1	1
ADD A, direct	Add direct byte to A	2	1
ADD A, @Ri	Add data memory to A	1	1
ADD A, #data	Add immediate to A	2	1
ADDC A, Rn	Add register to A with carry	1	1
ADDC A, direct	Add direct byte to A with carry	2	1
ADDC A, @Ri	Add data memory to A with carry	1	1
ADDC A, #data	Add immediate to A with carry	2	1
SUBB A, Rn	Subtract register from A with borrow	1	1
SUBB A, direct	Subtract direct byte from A with borrow	2	1
SUBB A, @Ri	Subtract data mem from A with borrow	1	1
SUBB A, #data	Subtract immediate from A with borrow	2	1
INC A	Increment A	1	1
INC Rn	Increment register	1	1
INC direct	Increment direct byte	2	1
INC @Ri	Increment data memory	1	1
DEC A	Decrement A	1	1
DEC Rn	Decrement register	1	1
DEC direct	Decrement direct byte	2	1
DEC @Ri	Decrement data memory	1	1
INC DPTR	Increment data pointer	1	2
MUL AB	Multiply A by B	1	4
DIV AB	Divide A by B	1	4
DA A	Decimal adjust A	1	1
<b>Logical Instructions</b>			
ANL A, Rn	AND register to A	1	1
ANL A, direct	AND direct byte to A	2	1
ANL A, @Ri	AND data memory to A	1	1
ANL A, #data	AND immediate to A	2	1
ANL direct, A	AND A to direct byte	2	1
ANL direct, #data	AND immediate data to direct byte	3	2
ORL A, Rn	OR register to A	1	1
ORL A, direct	OR direct byte to A	2	1
ORL A, @Ri	OR data memory to A	1	1
ORL A, #data	OR immediate to A	2	1
ORL direct, A	OR A to direct byte	2	1
ORL direct, #data	OR immediate data to direct byte	3	2
XRL A, Rn	Exclusive-OR register to A	1	1
XRL A, direct	Exclusive-OR direct byte to A	2	1
XRL A, @Ri	Exclusive-OR data memory to A	1	1
XRL A, #data	Exclusive-OR immediate to A	2	1
XRL direct, A	Exclusive-OR A to direct byte	2	1
XRL direct, #data	Exclusive-OR immediate to direct byte	3	2
CLR A	Clear A	1	1
CPL A	Compliment A	1	1
SWAP A	Swap nibbles of A	1	1
RL A	Rotate A left	1	1
RLC A	Rotate A left through carry	1	1
RR A	Rotate A right	1	1
RRC A	Rotate A right through carry	1	1

Mnemonic	Description	Size (bytes)	Instr. Cycles
<b>Boolean Instruction</b>			
CLR C	Clear Carry bit	1	1
CLR bit	Clear bit	2	1
SETB C	Set Carry bit to 1	1	1
SETB bit	Set bit to 1	2	1
CPL C	Complement Carry bit	1	1
CPL bit	Complement bit	2	1
ANL C,bit	Logical AND between Carry and bit	2	2
ANL C,#bit	Logical AND between Carry and not bit	2	2
ORL C,bit	Logical ORL between Carry and bit	2	2
ORL C,#bit	Logical ORL between Carry and not bit	2	2
MOV C,bit	Copy bit value into Carry	2	1
MOV bit,C	Copy Carry value into Bit	2	2
<b>Data Transfer Instructions</b>			
MOV A, Rn	Move register to A	1	1
MOV A, direct	Move direct byte to A	2	1
MOV A, @Ri	Move data memory to A	1	1
MOV A, #data	Move immediate to A	2	1
MOV Rn, A	Move A to register	1	1
MOV Rn, direct	Move direct byte to register	2	2
MOV Rn, #data	Move immediate to register	2	1
MOV direct, A	Move A to direct byte	2	1
MOV direct, Rn	Move register to direct byte	2	2
MOV direct, direct	Move direct byte to direct byte	3	2
MOV direct, @Ri	Move data memory to direct byte	2	2
MOV direct, #data	Move immediate to direct byte	3	2
MOV @Ri, A	Move A to data memory	1	1
MOV @Ri, direct	Move direct byte to data memory	2	2
MOV @Ri, #data	Move immediate to data memory	2	1
MOV DPTR, #data	Move immediate to data pointer	3	2
MOVC A, @A+DPTR	Move code byte relative DPTR to A	1	2
MOVC A, @A+PC	Move code byte relative PC to A	1	2
MOVB A, @Ri	Move external data (A8) to A	1	2
MOVB A, @DPTR	Move external data (A16) to A	1	2
MOVX @Ri, A	Move A to external data (A8)	1	2
MOVX @DPTR, A	Move A to external data (A16)	1	2
PUSH direct	Push direct byte onto stack	2	2
POP direct	Pop direct byte from stack	2	2
XCH A, Rn	Exchange A and register	1	1
XCH A, direct	Exchange A and direct byte	2	1
XCH A, @Ri	Exchange A and data memory	1	1
XCHD A, @Ri	Exchange A and data memory nibble	1	1
<b>Branching Instructions</b>			
ACALL addr 11	Absolute call to subroutine	2	2
LCALL addr 16	Long call to subroutine	3	2
RET	Return from subroutine	1	2
RETI	Return from interrupt	1	2
AJMP addr 11	Absolute jump unconditional	2	2
LJMP addr 16	Long jump unconditional	3	2
SJMP rel	Short jump (relative address)	2	2
JC rel	Jump on carry = 1	2	2
JNC rel	Jump on carry = 0	2	2
JB bit, rel	Jump on direct bit = 1	3	2
JNB bit, rel	Jump on direct bit = 0	3	2
JBC bit, rel	Jump on direct bit = 1 and clear	3	2
JMP @A+DPTR	Jump indirect relative DPTR	1	2
JZ rel	Jump on accumulator = 0	2	2
JNZ rel	Jump on accumulator 1= 0	2	2
CJNE A, direct, rel	Compare A, direct JNE relative	3	2
CJNE A, #d, rel	Compare A, immediate JNE relative	3	2
CJNE Rn, #d, rel	Compare reg, immediate JNE relative	3	2
CJNE @Ri, #d, rel	Compare ind, immediate JNE relative	3	2
DJNZ Rn, rel	Decrement register, JNZ relative	2	2
DJNZ direct, rel	Decrement direct byte, JNZ relative	3	2
<b>Miscellaneous Instruction</b>			
NOP	No operation	1	1

Rn: Any of the register R0 to R7  
 @Ri: Indirect addressing using Register R0 or R1  
 #data: immediate Data provided with Instruction  
 #data16: Immediate data included with instruction  
 bit: address at the bit level  
 rel: relative address to Program counter from +127 to -128  
 Addr11: 11-bit address range  
 Addr16: 16-bit address range  
 #d: Immediate Data supplied with instruction

**Special Function Registers (SFR)**

Addresses 80h to FFh of the SFR address space can be accessed in direct addressing mode only. The following table lists the VRS51C1000 Special Function Registers.

TABLE 5: SPECIAL FUNCTION REGISTERS (SFR)

SFR Register	SFR Adrs	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Reset Value
P0	80h	-	-	-	-	-	-	-	-	1111 1111b

**VRS51C1000 Program Memory**

The VRS51C1000 includes 64KB of on-chip Flash memory that can be used as program memory or as general non-volatile data storage memory using the In-Application Programming feature (IAP).

**ISP Boot Program Memory Zone**

The upper portion of the VRS51C1000 Flash memory can be reserved to store an ISP (In-System Programmable) boot loader program.

This boot program can be used to program the Flash memory via the serial interface (or via any other method) by making use of the In-Application Programming (IAP) feature of the VRS51C1000. This allows the processor to load the program from an external device or system, and program it into the Flash memory (See the *VRS51C1000 IAP feature* section)

The size of the memory block reserved for the ISP boot loader program (when activated) is adjustable from 512 Bytes up to 4K bytes in increments of 512 bytes.

When programming the ISP boot program into the VRS51C1000, the “lock bit” option should be activated in order to protect the ISP flash memory zone from being inadvertently erased (can happen when the Flash Erase operations are performed under the control of the ISP boot program) or to prevent the VRS51C1000 flash memory from being read back using a parallel programmer.

If an Erase operation is performed using a parallel programmer, the entire flash memory, including the ISP Boot program memory zone will be erased.

**ISP Program Start Conditions**

Setting the ISP page configuration to a value other than 0 will result in the Processor jumping to the base address of the ISP boot code when a hardware reset is performed (provided that the value FFh is present at program address 0000h).

When the ISP page configuration is set to 0 at the moment the device is programmed using a parallel programmer, the ISP boot feature will be disabled.

FIGURE3: VRS51C1000-ISP PROGRAM SIZE VS ISP CONFIG. VALUE

**Programming the ISP Boot Program**

The ISP boot program must be programmed into the device using a parallel programmer (such as the VERSAMCU-PPR) or a commercial parallel programmer that supports the VRS51C1000. The Flash memory reserved for the ISP program is defined by the parallel programmer software at the moment the device is programmed.

**VRS51C1000 ISPvX Firmware boot program**

An ISP boot loader program is available for the VRS51C1000 (ISPvX Firmware, x = revision, see Ramtron website for latest revision).

The ISPvX Firmware enables In-System-Programming of the VRS51C1000 on the final application PCB using the device’s UART interface. See the following figure for a hardware configuration example. Other configurations are also possible.

FIGURE 4: VRS51C1000 INTERFACE FOR IN-SYSTEM PROGRAMMING

See Ramtron’s website in order to download the “Versa Ware ISP” Window’s™ application which allows communication with the ISPvX firmware.

The VRS51C1000 can be ordered with or without the ISPvX bootloader firmware (see Ordering information section of this Datasheet for part number information).

The ISPvX bootloader firmware can also be programmed into the VRS51C1000 by the user. Source code is included with the Versa Ware ISP application software.

For more information on the ISPvX firmware, please consult the “VRS51C1000 ISPvX Firmware User Guide.pdf” available on the Ramtron web site.

**VRS51C1000 IAP feature**

The VRS51C1000 IAP feature refers to the ability of the processor to self-program the Flash memory from within the user program.

Five SFR registers serve to control the IAP operation. The description of these registers is provided below.

**System Control Register**

By default upon reset, the IAP feature of the VRS51C1000 is de-activated. The IAPE bit of the SYSCON register is used to enable (and disable) the VRS51C1000 IAP function.

TABLE 6: SYSTEM CONTROL REGISTER (SYSCON) – SFR BFH

7	6	5	4	3	2	1	0
WDR	Unused			IAPE	XRAME	ALEI	

Bit	Mnemonic	Description
7	WDR	This is the Watchdog Timer reset bit. It will be set to 1 when the reset signal generated by WDT overflows.
6	Unused	-
5	Unused	-
4	Unused	-
3	Unused	-
2	IAPE	IAP function enable bit
1	XRAME	768 byte on-chip enable bit
0	ALEI	ALE output inhibit bit, which is used to reduce EMI.

**IAP Flash Address and Data Registers**

The IAPFADHI and IAPADLO registers are used to specify the address at which the IAP function will be performed.

TABLE 7: IAP FLASH ADDRESS HIGH - SFR F4H

7	6	5	4	3	2	1	0
IAPFADHI[15:8]							

TABLE 8: IAP FLASH ADDRESS LOW - SFR F5H

7	6	5	4	3	2	1	0
IAPFADLO[15:8]							

The IAPFDATA SFR register contains the Data byte required to perform the IAP function.

TABLE 9: IAP FLASH DATA REGISTER - SFR F6H

7	6	5	4	3	2	1	0
IAPFDATA[7:0]							

**IAP Flash Control Register**

The VRS51C1000 IAP function operation is controlled by the IAP Flash Control register, IAPFCTRL.

Setting the IAPSTART bit to 1, starts the execution of the IAP command specified by the IAPFCT[1:0] bits of the IAP Flash Control register.

TABLE 10:IAP FLASH CONTROL REGISTER - SFR F7H

7	6	5	4	3	2	1	0
IAPFCTRL[15:8]							

Bit	Mnemonic	Description
7	IAPSTART	IAP Selected operation Start sequence
6	Unused	-
5	Unused	-
4	Unused	-
3	Unused	-
2	Unused	-
1	IAPFCT[1:0]	Flash Memory IAP Function
0		

The IAP sub-system handles four different functions. The IAP function performed is controlled by the IAPFCT bits as follows:

TABLE 11:IAP FUNCTIONS

IAPFCT[1:0] Bits value	IAP Function
00	Flash Byte Program
01	Flash Erase Protect
10	Flash Page Erase
11	Flash Erase

It is important to note that for security reasons, the IAPSTART bit of the IAPFCTRL register is configured as read-only by default.

In order to set the IAPSTART bit to 1, the following operation sequence must be performed first:

```
MOV IAPFDATA,#55h
MOV IAPFDATA,#AAh
MOV IAPFDATA,#55h
```

The IAPSTART bit can be set to 1.

Once the start bit is set to 1, the IAP sub-system will read the contents of the IAP Flash Address and Data registers and hold the VRS51C1000 program counter at its current value until the IAP operation is completed. When the IAP operation is complete, the IAPSTART bit is cleared and the program will continue executing.

**IAP Byte Program Function**

The IAP byte program function is used to program a byte into the specified Flash memory location under the control of the IAP feature. See the following program example:

```
IAP_PROG: MOV IAPFDATA,#55H ;Sequence to Enable Writing
           MOV IAPFDATA,#0AAH ; the IAPSTART bit
           MOV IAPFDATA,#55H

           MOV SYSCON,#04H ;ENABLE IAP FUNCTION
           MOV IAPFADHI, FADRSH ;Set MSB of address to program
           MOV IAPFADLO,FADRSL ;Set LSB of address to program
           MOV IAPFDATA,FDATA ;Set Data to Program
           MOV IAPFCTRL,#80H ;Set the IAP Start bit
```

\*\*The program Counter will stop until the IAP function is completed

**IAP Page Erase Function**

By using the IAP feature, it is possible to perform a Page erase of the VRS51C1000 Flash memory (note that the memory area occupied by the ISP boot program cannot be page erased). Each page is 512 Bytes in size.

To perform a flash page erase, the page address is specified by the XY (hex) value written into the IAPFADHI register (The value 00h must be written into the IAPFADLO registers)

If the “Y” portion of the IAPFADHI register represents an even number, the page that will be erased corresponds to the range XY00h to X(Y+1)FFh

If the “Y” portion of the IAPFADHI register represents an odd number, the page that will be erased corresponds to the range X(Y-1)00h to XYFFh

The following program example erases the page corresponding to the address B000h-CFFFh

```
** Erase Flash page located at address B000h to CFFFh.
PageErase: MOV IAPFDATA,#55H ;Sequence to Enable Writing
           MOV IAPFDATA,#0AAH ; the IAPSTART bit
           MOV IAPFDATA,#55H

           MOV SYSCON,#04H ;ENABLE IAP FUNCTION
           MOV IAPFADHI, #0B0h ;Set MSB of Page address to erase
           MOV IAPFADLO,#00h ;Set LSB of address = 00
           MOV IAPFCTRL,#82H ;SET THE IAP START BIT
```

**IAP Chip Erase Function**

The IAP chip erase function will erase the entire flash memory contents with the exception of the ISP boot program area. Running this function will also automatically unprotect the Flash memory.

**IAP Chip Protect Function**

When the chip protect function is enabled, values read back from Flash memory will be 00h.

**Program Status Word Register**

The PSW register is a bit addressable register that contains the status flags (CY, AC, OV, P), user flag (F0) and register bank select bits (RS1, RS0) of the 8051 processor.

TABLE 12: PROGRAM STATUS WORD REGISTER (PSW) - SFR DOH

7	6	5	4	3	2	1	0
CY	AC	F0	RS1	RS0	OV	-	P

Bit	Mnemonic	Description
7	CY	Carry Bit
6	AC	Auxiliary Carry Bit from bit 3 to 4.
5	F0	User definer flag
4	RS1	R0-R7 Registers bank select bit 0
3	RS0	R0-R7 Registers bank select bit 1
2	OV	Overflow flag
1	-	-
0	P	Parity flag

RS1	RS0	Active Bank	Address
0	0	0	00h-07h
0	1	1	08h-0Fh
1	0	2	10h-17h
1	1	3	18-1Fh

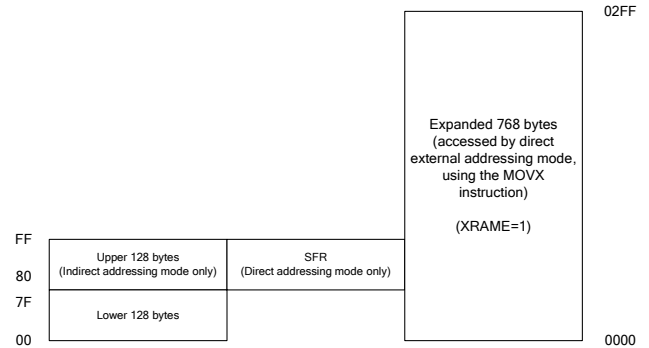

**Data Pointer**

The VRS51C1000 has one 16-bit data pointer. The DPTR is accessed via two SFR addresses: DPL located at address 82h and DPH located at address 83h.

**Data Memory**

The VRS51C1000 has total of 1KB of on-chip SRAM with a 256 byte subset of this block mapped as the internal memory structure of a standard 8052. The remaining 768 byte sub-block can be accessed using external memory addressing via the MOVX instruction.

FIGURE 5: VRS51C1000 DATA MEMORY

By default after reset, the expanded SRAM area is disabled. It can be enabled by setting the XRAM bit of the SYSCON register located at address BFh in the SFR.

**Lower 128 bytes (00h to 7Fh, Bank 0 & Bank 1)**

The lower 128 bytes of data memory (from 00h to 7Fh) can be summarized as follows:

- Address range 00h to 7Fh can be accessed in direct and indirect addressing modes.
- Address range 00h to 1Fh includes R0-R7 registers area.
- Address range 20h to 2Fh is bit addressable.
- Address range 30h to 7Fh is not bit addressable and can be used as general-purpose storage.

**Upper 128 bytes (80h to FFh, Bank 2 & Bank 3)**

The upper 128 bytes of the data memory ranging from 80h to FFh can be accessed using indirect addressing or by using the bank mapping in direct addressing mode.

**Stack Pointer**

The Stack Pointer is a register located at address 81h of the SFR register area whose value corresponds to the address of the last item that was put on the processor stack. Each time new data is put on the Stack Pointer, the value of the Stack Pointer is incremented.

By default, the Stack Pointer value is 07h, but it is possible to program the processor stack pointer to

point anywhere in the 00h to FFh range of SRAM memory. When a function call is performed or an interrupt is serviced, the 16-bit return address (two bytes) is stored on the stack. Data can be placed manually on the Stack by using the PUSH and POP functions.

**Expanded SRAM Access Using the MOVX @DPTR Instruction (0000-02FF, Bank4-Bank15)**

The 768 bytes of the expanded SRAM data memory occupies addresses 0000h to 02FFh. This can be accessed using external direct addressing (i.e. using the MOVX instruction) or by using bank mapping direct addressing. Note that in the case of indirect addressing using the MOVX @DPTR instruction, if the address is larger than 02FFh, the VRS51C1000 will access off-chip memory in the external memory space using the external memory control signals

**Internal SRAM Control Register**

The 768 bytes of expanded SRAM of the VRS51C1000 can also be accessed using the MOVX @Rn instruction (where n = 0 or 1). This instruction can only access data in a range of 256 bytes. The internal SRAM Control Register, RCON, allows users to select which part of the expanded SRAM will be accessed by this instruction by configuring the value of the RAMS0 and RAMS1 bits.

The default setting of the RAMS1 and RAMS0 bits is 00 (page 0). Each page has 256 bytes.

TABLE 13: INTERNAL SRAM CONTROL REGISTER (RCON) - SFR 85H

7	6	5	4	3	2	1	0
Unused						RAMS1	RAMS0

Bit	Mnemonic	Description
7	Unused	-
6	Unused	-
5	Unused	-
4	Unused	-
3	Unused	-
2	Unused	-
1	RAMS1	These two bits are used with Rn of instruction OVX @Rn, n=1,0 for mapping (see section on extended 768 bytes) RAMS1, RAMS0 Mapped area 00 000h-0FFh 01 100h-1FFh 10 200h-2FFh 11 XY00h-XYFF* *Externally generated
0	RAMS0	

Example:

Suppose that RAMS1, RAMS0 are set to 0 and 1 respectively and Rn has a value of 45h.

Performing MOVX @Rn, A, (where n is 0 or 1) allows the user to transfer the value of A to the expanded SRAM at address 145h (page 1).

Note that when both RAM1 and RAM0 are set to 1, the value of P2 defines the upper byte and Rn defines the lower byte of the external address. In this case the device will access off-chip memory in the external memory space using the external memory control signals, Off chip peripherals can therefore be mapped into the "P2value"00h to "P2value"FFh address range

**Data Bank Control Register**

The DBANK register allows the user to enable the Data Bank Select function and map the entire contents of the SRAM memory in the range of 40h to 7Fh for applications that would require direct addressing of the expanded SRAM.

The Data Bank Select function is activated by setting the Data Bank Select enable bit (BSE) to 1. Setting this bit to zero disables this function. The lower nibble of this register controls the mapping of the entire 1K byte on-chip SRAM space into the 040h-07Fh range.

TABLE 14: DATA BANK CONTROL REGISTER (DBANK) – SFR 86H

7	6	5	4	3	2	1	0
BSE	Unused			BS3	BS2	BS1	BS0

Bit	Mnemonic	Description
7	BSE	Data Bank Select Enable Bit BSE=1, Data Bank Select enabled BSE=0, Data Bank Select disabled
6	Unused	-
5	Unused	-
4	Unused	-
3	BS3	Allows the mapping of the 1KB of SRAM into the 040h - 07Fh SRAM space
2	BS2	
1	BS1	
0	BS0	

Windowed access to all the 1KB on-chip SRAM in the range of 40h-7Fh is described in the following table.

TABLE 15: BANK MAPPING DIRECT ADDRESSING MODE

BS3	BS2	BS1	BS0	040h~07fh mapping address	Note
0	0	0	0	000h-03Fh	Lower 128 bytes SRAM
0	0	0	1	040h-07Fh	Lower 128 bytes SRAM
0	0	1	0	080h-0BFh	Upper 128 bytes SRAM
0	0	1	1	0C0h-0FFh	Upper 128 bytes SRAM
0	1	0	0	0000h-003Fh	On-chip expanded 768 bytes SRAM
0	1	0	1	0040h-007Fh	On-chip expanded 768 byte SRAM
0	1	1	0	0080h-00BFh	On-chip expanded 768 byte SRAM
0	1	1	1	00C0h-00FFh	On-chip expanded 768 byte SRAM
1	0	0	0	0100h-013Fh	On-chip expanded 768 bytes SRAM
1	0	0	1	0140h-017Fh	On-chip expanded 768 bytes SRAM
1	0	1	0	0180h-01BFh	On-chip expanded 768 bytes SRAM
1	0	1	1	01C0h-01FFh	On-chip expanded 768 bytes SRAM
1	1	0	0	0200h-023Fh	On-chip expanded 768 bytes SRAM
1	1	0	1	0240h-027Fh	On-chip expanded 768 bytes SRAM
1	1	1	0	0280h-02BFh	On-chip expanded 768 bytes SRAM
1	1	1	1	02C0h-02FFh	On-chip expanded 768 bytes SRAM

Example: User writes #55h to address 203h:

```

MOV DBANK, #8CH      ;Set bank mapping 40h-07Fh to
                     ;0200h-023Fh
MOV A, #55H          ;Store #55H to A
MOV 43H, A           ;Write #55H to 0203h ;address
    
```

## Description of Peripherals

### System Control Register

The following table describes the System Control Register (SYSCON).

The WDRESET bit (7) indicates whether a reset was due to the Watchdog Timer overflow.

The IAPE bit is used to enable and disable the IAP function.

When set to 1, the XRAME bit allows the user to enable the on-chip expanded 768 bytes of SRAM. By default, upon reset, the XRAME bit is set to 0.

Bit 0 of the SYSCON register is the ALE output inhibit bit. Setting this bit to 1 will inhibit the Fosc/6 clock signal output to the ALE pin.

TABLE 16: SYSTEM CONTROL REGISTER (SYSCON) – SFR BFh

7	6	5	4	3	2	1	0
WDR	Unused			IAPE	XRAME		ALEI

Bit	Mnemonic	Description
7	WDR	This is the Watchdog Timer reset bit. It will be set to 1 when the reset signal generated by WDT overflows.
6	Unused	-
5	Unused	-
4	Unused	-
3	Unused	-
2	IAPE	IAP function enable bit
1	XRAME	768 bytes on-chip SRAM enable bit
0	ALEI	ALE output inhibit bit, which is used to reduce EMI.

**Power Control Register**

The VRS51C1000 provides two power saving modes, Idle and Power Down, which are controlled by the PDOWN and IDLE bits of the PCON register at address 87h.

TABLE 17: POWER CONTROL REGISTER (PCON) - SFR 87H

7	6	5	4	3	2	1	0
Unused						RAMS1	RAMS0

Bit	Mnemonic	Description
7	SMOD	1: Double the baud rate of the serial port frequency that was generated by Timer 1.  0: Normal serial port baud rate generated by Timer 1.
6		
5		
4		
3	GF1	General Purpose Flag
2	GF0	General Purpose Flag
1	PDOWN	Power down mode control bit
0	IDLE	Idle mode control bit

In Idle mode, the processor is stopped but the oscillator continues to run. The content of the SRAM, I/O state and SFR registers are maintained and the Timer and external interrupts are left operational. The processor will be woken up when an external event, triggering an interrupt, occurs.

In Power Down mode, the oscillator and peripherals are disabled. The contents of the SRAM and the SFR registers, however, are maintained. The only way to exit from the Power Down mode is via a hardware Reset (note that the Watchdog Timer is stopped in Power Down).

When the VRS51C1000 is in power down, its current consumption drops to about 150uA.

The SMOD bit of the PCON register controls the oscillator divisor applied to the Timer 1 when used as a baud rate generator for the UART. Setting this bit to 1 doubles the UART's baud rate generator frequency.

**Input/Output Ports**

The VRS51C1000 has 36 bi-directional lines grouped into four 8-bit I/O ports and one 4-bit I/O port. These I/Os can be individually configured as input or output.

Except for the P0 I/Os, which are of the open drain type, each I/O is made of a transistor connected to ground and a weak pull-up resistor (transistor based).

Writing a 0 in a given I/O port bit register will activate the transistor connected to VSS, this will bring the I/O to a LOW level.

Writing a 1 into a given I/O port bit register de-activates the transistor between the pin and ground. In this case an internal weak pull-up resistor will bring the pin to a HIGH level (except for Port 0 which is open-drain).

To use a given I/O as an input, a 1 must be written into its associated port register bit. By default, upon reset all I/Os are configured as inputs. The VRS51C1000 I/O ports are not designed to source current.

**Structure of the P1, P2, P3 and P4 Ports**

The following figure provides the general structure of the P1, P2 and P3 port I/Os. For these ports, the output stage is composed of a transistor (X1) and a transistor set configured as a weak pull-up. Note that the figure below does not show the intermediary logic that connects the output of the register and the output stage together because this logic varies with the auxiliary function of each port.

FIGURE 6: GENERAL STRUCTURE OF THE OUTPUT STAGE OF P1, P2, P3 AND P4

Each I/O may be used independently as a logical input or output. When used as an input, as mentioned in previously, the corresponding bit register must be high. This corresponds to #Q=0 in the above figure.

The transistor would be off (open-circuited) and current would flow from the VCC to the pin, generating a logical high at the output. Note that if an external device with a logical low value is connected to the pin, current will flow out of the pin.

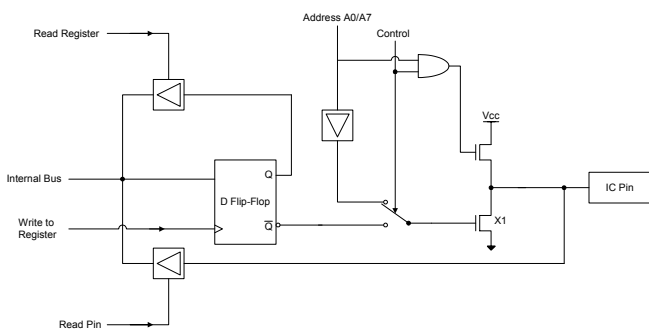

The presence of the pull-up resistance even when the I/O's are configured as inputs means that a small current is likely to flow from the VRS51C1000 I/O's pull-up resistors to the driving circuit when the inputs are driven low. For this reason, the VRS51C1000 I/O ports P1, P2, P3 and P4 are called "quasi bi-directional".

**Structure of Port 0**

The internal structure of P0 is shown in the next figure. As opposed to the other ports, P0 is truly bi-directional. In other words, when used as an input, it is considered to be in a floating logical state (high impedance state). This arises from the absence of the internal pull-up resistance. The pull-up resistance is actually replaced by a transistor that is only used when the port is configured for accessing external memory/data bus (EA=0).

When used as an I/O port, P0 acts as an open drain port and the use of an external pull-up resistor is likely to be required for most applications.

FIGURE 7: PORT P0'S PARTICULAR STRUCTURE

When P0 is used as an external memory bus input (for a MOVX instruction, for example), the outputs of the register are automatically forced to 1.

The bit addressable P0 register, located at address 80h, controls the P0 pin directions when used as I/O (see following table).

TABLE 18: PORT 0 REGISTER (P0) - SFR 80H

7	6	5	4	3	2	1	0
P0.7	P0.6	P0.5	P0.4	P0.3	P0.2	P0.1	P0.0

Bit	Mnemonic	Description
7	P0.7	For each bit of the P0 register correspond to an I/O line:  0: Output transistor pull the line to 0V 1: The output transistor is blocked so the pull-up brings the I/O to 5V.
6	P0.6	
5	P0.5	
4	P0.4	
3	P0.3	
2	P0.2	
1	P0.1	
0	P0.0	

**Port 2**

Port P2 is similar to Port 1 and Port 3, the difference being that P2 is used to drive the A8-A15 lines of the address bus when the EA line of the VRS51C1000 is held low at reset time or when a MOVX instruction is executed.

Like the P0, P1 and P3 registers, the P2 register is bit addressable.

TABLE 19: PORT 2 REGISTER (P2) - SFR A0H

7	6	5	4	3	2	1	0
P2.7	P2.6	P2.5	P2.4	P2.3	P2.2	P2.1	P2.0

Bit	Mnemonic	Description
7	P2.7	For each bit of the P2 register correspond to an I/O line:  0: Output transistor pull the line to 0V 1: The output transistor is blocked so the pull-up brings the I/O to 5V.
6	P2.6	
5	P2.5	
4	P2.4	
3	P2.3	
2	P2.2	
1	P2.1	
0	P2.0	

**Port P0 and P2 as Address and Data Bus**

The output stage may receive data from two sources:

- The outputs of register P0 or the bus address itself multiplexed with the data bus for P0.
- The outputs of the P2 register or the high byte (A8 through A15) of the bus address for the P2 port.

**FIGURE 8: P2 PORT STRUCTURE**

When the ports are used as an address or data bus, the special function registers P0 and P2 are disconnected from the output stage, the 8 bits of the P0 register are forced to 1 and the content of the P2 register remains constant.

**Port 1**

The P1 register controls the direction of the Port 1 I/O pins. Writing a 1 into the P1.x bit (see following table) of the P1 register configures the bit as an output, presenting a logic 1 to the corresponding I/O pin, or enables use of the I/O pin as an input. Writing a 0 activates the output “pull-down” transistor which will force the corresponding I/O line to a logic Low.

**TABLE 20: PORT 1 REGISTER (P1) - SFR 90H**

7	6	5	4	3	2	1	0
P1.7	P1.6	P1.5	P1.4	P1.3	P1.2	P1.1	P1.0

Bit	Mnemonic	Description
7	P1.7	For each bit of the P1 register correspond to an I/O line:
6	P1.6	
5	P1.5	
4	P1.4	0: Output transistor pull the line to 0V 1: The output transistor is blocked so the pull-up bring the I/O to 5V.
3	P1.3	
2	P1.2	
1	P1.1	To configure P3 pins as input or use alternate P3 function the corresponding bit must be set to 1.
0	P1.0	

**Auxiliary Port 1 Functions**

The Port 1 I/O pins are shared with the PWM outputs, Timer 2 EXT and T2 inputs as shown below:

Pin	Mnemonic	Function
P1.0	T2	Timer 2 counter input
P1.1	T2EX	Timer2 Auxiliary input
P1.2		
P1.3	PWM0	PWM0 output
P1.4	PWM1	PWM1 output
P1.5	PWM2	PWM2 output
P1.6	PWM3	PWM3 output
P1.7	PWM4	PWM4 output

**Port 3**

structure of Port 3 is similar to that of Port 1.

**TABLE 21: PORT 3 REGISTER (P3) - SFR B0H**

7	6	5	4	3	2	1	0
P3.7	P3.6	P3.5	P3.4	P3.3	P3.2	P3.1	P3.0

Bit	Mnemonic	Description
7	P3.7	For each bit of the P3 register correspond to an I/O line:
6	P3.6	
5	P3.5	
4	P3.4	0: Output transistor pull the line to 0V 1: The output transistor is blocked so the pull-up brings the I/O to 5V.
3	P3.3	
2	P3.2	
1	P3.1	To configure P3 pins as input or use alternate P3 function the corresponding bit must be set to 1.
0	P3.0	

**Auxiliary P3 Port Functions**

The Port 3 I/O pins are shared with the UART interface, INT0 and the INT1 interrupts, Timer 0 and Timer 1 inputs and finally the #WR and #RD lines when external memory accesses are performed.

FIGURE 9: P3 PORT STRUCTURE

The following table describes the auxiliary function of the Port 3 I/O pins.

TABLE 22: P3 AUXILIARY FUNCTION TABLE

Pin	Mnemonic	Function
P3.0	RXD	Serial Port: Receive data in asynchronous mode. Input and output data in synchronous mode.
P3.1	TXD	Serial Port: Transmit data in asynchronous mode. Output clock value in synchronous mode.
P3.2	$\overline{\text{INT0}}$	External Interrupt 0 Timer 0 Control Input
P3.3	$\overline{\text{INT1}}$	External Interrupt 1 Timer 1 Control Input
P3.4	T0	Timer 0 Counter Input
P3.5	T1	Timer 1 Counter Input
P3.6	$\overline{\text{WR}}$	Write signal for external memory
P3.7	$\overline{\text{RD}}$	Read signal for external memory

Port 4

Port 4 has four related I/O pins and its port address is located at 0D8H.

TABLE 23: PORT 4 (P4) - SFR D8H

7	6	5	4	3	2	1	0
Unused			P4.3	P4.2	P4.1	P4.0	

Bit	Mnemonic	Description
7	Unused	-
6	Unused	-
5	Unused	-
4	Unused	-
3	P4.3	Used to output the setting to pins P4.3, P4.2, P4.1, P4.0 respectively.
2	P4.2	
1	P4.1	
0	P4.0	

On the VRS51C1000, the Port 4 output buffers can sink up to 20mA, which allow direct drive of LED displays.

Software Port Control

Some instructions allow the user to read the logic state of the output pin, while others allow the user to read the content of the associated port register. These instructions are called *read-modify-write* instructions. A list of these instructions may be found in the table below.

Upon execution of these instructions, the content of the port register (at least 1 bit) is modified. The other read instructions take the present state of the input into account. For example, the instruction ANL P3,#01h obtains the value in the P3 register; performs the desired logic operation with the constant 01h; and re-copies the result into the P3 register. When users want to take the present state of the inputs into account, they must first read these states and perform an AND operation between the read value and the constant.

```
MOV A, P3; State of the inputs in the accumulator
ANL A, #01; AND operation between P3 and 01h
```

When the port is used as an output, the register contains information on the state of the output pins. Measuring the state of an output directly on the pin is inaccurate because the electrical level depends mostly on the type of charge that is applied to it. The functions shown below take the value of the register rather than that of the pin.

TABLE 24: LIST OF INSTRUCTIONS THAT READ AND MODIFY THE PORT USING REGISTER VALUES

Instruction	Function
ANL	Logical AND ex: ANL P0, A
ORL	Logical OR ex: ORL P2, #01110000B
XRL	Exclusive OR ex: XRL P1, A
JBC	Jump if the bit of the port is set to 0
CPL	Complement one bit of the port
INC	Increment the port register by 1
DEC	Decrement the port register by 1
DJNZ	Decrement by 1 and jump if the result is not equal to 0
MOV P.,C	Copy the held bit C to the port
CLR P.x	Set the port bit to 0
SETB P.x	Set the port bit to 1

**Port Operation Timing**

**Writing to a Port (Output)**

When an operation results in a modification of the content in a port register, the new value is placed at the output of the D flip-flop during the last machine cycle that the instruction needed to execute.

**Reading a Port (Input)**

In order to be sampled, the signal duration present on the I/O inputs must be longer than  $F_{osc}/12$ .

**I/O Ports Driving Capability**

The maximum allowable continuous current that the device can sink on an I/O port is described in the following table.

Maximum sink current on one given I/O	10mA
Maximum total sink current for P0	26mA
Maximum total sink current for P1, 2, 3	15mA
Maximum total sink current for P4	20mA
Maximum total sink current on all I/O	91mA

As explained previously, the Port 4 output buffers can sink up to 20mA, which allow driving of LED displays.

It is not recommended to exceed the sink current outlined in the above table. Doing so is likely to make the low-level output voltage exceed the device's specification and it is likely to affect the device's reliability.

The VRS51C1000 I/O ports are not designed to source current.

**VRS51C1000 Timers**

The VRS51C1000 includes three 16-bit timers: Timer 0, Timer 1 and Timer 2.

The Timers can operate in two modes:

- o Event counting mode
- o Timer mode

When operating in event counting mode, the counter is incremented each time an external event, such as a transition in the logical state of the Timer input (T0, T1, T2 input), is detected. When operating in Timer mode, the counter is incremented by the microcontroller's system clock ( $F_{osc}/12$ ) or by a divided version of it.

**Timer 0 and Timer 1**

Timers 0 and 1 have four Modes of operation. These Modes allow the user to change the size of the counting register or to authorize an automatic reload when provided with a specific value. Timer 1 can also be used as a baud rate generator to generate communication frequencies for the serial interface.

Timer 1 and Timer 0 are configured by the TMOD and TCON registers.

TABLE 25: TIMER MODE CONTROL REGISTER (TMOD) – SFR 89H

7	6	5	4	3	2	1	0
GATE1	C/T1	T1M1	T1M0	GATE0	C/T0	T0M1	T0M0

Bit	Mnemonic	Description
7	GATE1	1: Enables external gate control (pin INT1 for Counter 1). When INT1 is high, and TRx bit is set (see TCON register), a counter is incremented every falling edge on the T1IN input pin.
6	C/T1	Selects timer or counter operation (Timer 1). 1 = A counter operation is performed 0 = The corresponding register will function as a timer.
5	T1M1	Selects the operating mode of Timer/Counter 1
4	T1M0	
3	GATE0	If set, enables external gate control (pin INT0 for Counter 0). When INT0 is high, and TRx bit is set (see TCON register), a counter is incremented every falling edge on the T0IN input pin.
2	C/T0	Selects timer or counter operation (Timer 0). 1 = A counter operation is performed 0 = The corresponding register will function as a timer.
1	T0M1	Selects the operating mode of Timer/Counter 0.
0	T0M0	

The table below summarizes the four modes of operation of Timers 0 and 1. The timer operating mode is selected by the bits T1M1/T1M0 and T0M1/T0M0 of the TMOD register.

TABLE 26: TIMER/COUNTER MODE DESCRIPTION SUMMARY

M1	M0	Mode	Function
0	0	Mode 0	13-bit Counter
0	1	Mode 1	16-bit Counter
1	0	Mode 2	8-bit auto-reload Counter/Timer. The reload value is kept in TH0 or TH1, while TL0 or TL1 is incremented every machine cycle. When TLx overflows, the value of THx is copied to TLx.
1	1	Mode 3	If Timer 1 M1 and M0 bits are set to 1, Timer 1 stops.

**Timer 0, Timer 1 Counter / Timer Functions**

**Timing Function**

When Timer 1 or Timer 0 is configured to operate as a Timer, its value is automatically incremented at every machine cycle. Once the Timer value rolls over, a flag is raised and the counter acquires a value of zero. The overflow flags (TF0 and TF1) are located in the TCON register.

The TR0 and TR1 bit of the TCON register gates the corresponding timer operation. In order for the Timer to run, the corresponding TRx bit must be set to 1.

The IT0 and IT1 bits of the TCON register control the event that will trigger the External Interrupt as follows:

IT0 = 0: The INT0, if enabled, occurs if a Low Level is present on P3.2

IT0 = 1: The INT0, if enabled, occurs if a High to Low transition is detected on P3.2

IT1 = 0: The INT1, if enabled, occurs if a Low Level is present on P3.3

IT1 = 1: The INT1, if enabled, occurs if a High to Low transition is detected on P3.3

The IE0 and IE1 bits of the TCON register are External flags that indicate that a transition has been detected on the INT0 and INT1 interrupt pins, respectively.

If the external interrupt is configured as edge sensitive, the corresponding IE0 and IE1 flag is automatically cleared when the corresponding interrupt is serviced.

If the external interrupt is configured as level sensitive, then the corresponding flag must be cleared by the software.

TABLE 27: TIMER 0 AND 1 CONTROL REGISTER (TCON) –SFR 88H

7	6	5	4	3	2	1	0
TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0

Bit	Mnemonic	Description
7	TF1	Timer 1 Overflow Flag. Set by hardware on Timer/Counter overflow. Cleared by hardware on Timer/Counter overflow. Cleared by hardware when processor vectors to interrupt routine.
6	TR1	Timer 1 Run Control Bit. Set/cleared by software to turn Timer/Counter on or off.
5	TF0	Timer 0 Overflow Flag. Set by hardware on Timer/Counter overflow. Cleared by hardware when processor vectors to interrupt routine.
4	TR0	Timer 0 Run Control Bit. Set/cleared by software to turn Timer/Counter on or off.
3	IE1	Interrupt Edge Flag. Set by hardware when external interrupt edge is detected. Cleared when interrupt processed.
2	IT1	Interrupt 1 Type Control Bit. Set/cleared by software to specify falling edge/low level triggered external interrupts.
1	IE0	Interrupt 0 Edge Flag. Set by hardware when external interrupt edge is detected. Cleared when interrupt processed.
0	IT0	Interrupt 0 Type control bit. Set/cleared by software to specify falling edge/low level triggered external interrupts.

**Counting Function**

When operating as a counter, the Timer’s register is incremented at every falling edge of the T0 and T1 signals located at the input of the timer.

When the sampling circuit sees a high immediately followed by a low in the next machine cycle, the counter is incremented. Two machine cycles are required to detect and record an event. In order to be properly sampled, the duration of the event presented to the Timer input should be greater than 1/24 of the oscillator frequency.

**Timer 0 / Timer 1 Operating Modes**

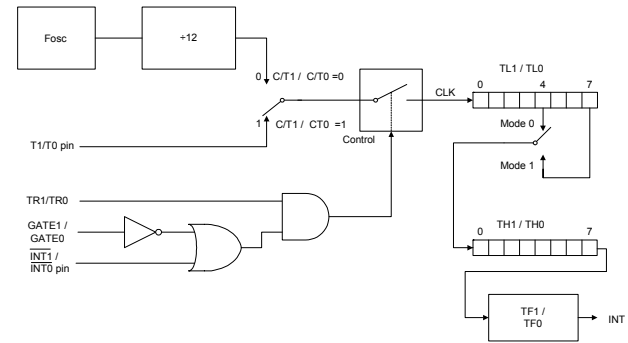

The user may change the operating mode by setting the M1 and M0 bits of the TMOD SFR.

**Mode 0**

A schematic representation of this mode of operation is presented in the figure below. In Mode 0, the Timer operates as 13-bit counter made up of 5 LSBs from the TLx register and the 8 upper bits coming from the THx register. When an overflow causes the value of the register to roll over to 0, the TFx interrupt signal goes

to 1. The count value is validated as soon as TRx goes to 1 and the GATE bit is 0, or when INTx is 1.

FIGURE 10: TIMER/COUNTER 1 MODE 0: 13-BIT COUNTER

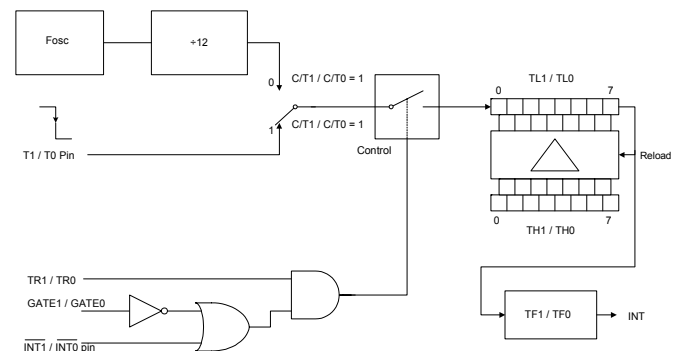

**Mode 1**

Mode 1 is almost identical to Mode 0, with the difference being that in Mode 1, the counter/timer uses the full 16-bits of the Timer.

**Mode 2**

In this Mode, the register of the Timer is configured as an 8-bit auto-re-loadable Counter/Timer. In Mode 2, the TLx is used as the counter. In the event of a counter overflow, the TFx flag is set to 1 and the value contained in THx, which is preset by software, is reloaded into the TLx counter. The value of THx remains unchanged.

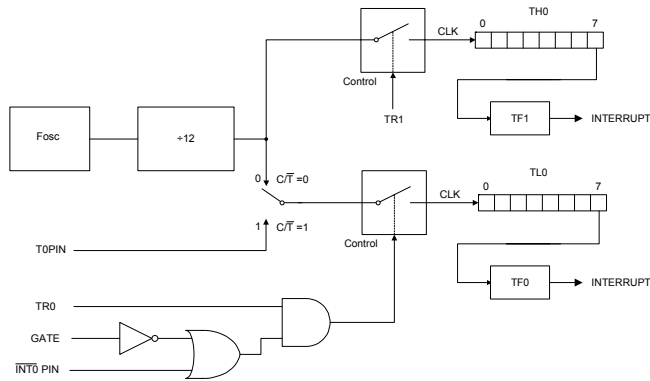

FIGURE 11: TIMER/COUNTER 1 MODE 2: 8-BIT AUTOMATIC RELOAD

**Mode 3**

In Mode 3, Timer 1 is blocked as if its control bit, TR1, was set to 0. In this mode, Timer 0's registers TL0 and TH0 are configured as two separate 8-bit counters. The TL0 counter uses Timer 0's control bits (C/T, GATE, TR0, INT0, TF0), the TH0 counter is held in Timer Mode (counting machine cycles) and gains control over TR1 and TF1 from Timer 1. At this point, TH0 controls the Timer 1 interrupt.

FIGURE 12: TIMER/COUNTER 0 MODE 3

**Timer 2**

Timer 2 of the VRS51C1000 is a 16-bit Timer/Counter and is similar to Timers 0 and 1 in that it can operate either as an event counter or as a timer. This is controlled by the C/T2 bit in the T2CON special function register. Timer 2 has three operating modes - Auto-Load, Capture and Baud Rate Generator. These modes are selected via the T2CON SFR. The following table describes T2CON special function register bits.

TABLE 28: TIMER 2 CONTROL REGISTER (T2CON) –SFR C8H

7	6	5	4	3	2	1	0
TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/T2	CP/RL2

Bit	Mnemonic	Description
7	TF2	Timer 2 Overflow Flag: Set by an overflow of Timer 2 and must be cleared by software. TF2 will not be set when either RCLK =1 or TCLK =1.
6	EXF2	Timer 2 external flag change in state occurs when either a capture or reload is caused by a negative transition on T2EX and EXEN2=1. When Timer 2 is enabled, EXF=1 will cause the CPU to Vector to the Timer 2 interrupt routine. Note that EXF2 must be cleared by software.

5	RCLK	Serial Port Receive Clock Source. 1: Causes Serial Port to use Timer 2 overflow pulses for its receive clock in Modes 1 and 3.  0: Causes Timer 1 overflow to be used for the Serial Port receive clock.
4	TCLK	Serial Port Transmit Clock. 1: Causes Serial Port to use Timer 2 overflow pulses for its transmit clock in Modes 1 and 3.  0: Causes Timer 1 overflow to be used for the Serial Port transmit clock.
3	EXEN2	Timer 2 External Mode Enable. 1: Allows a capture or reload to occur as a result of a negative transition on T2EX if Timer 2 is not being used to clock the Serial Port. 0: Causes Timer 2 to ignore events at T2EX.
2	TR2	Start/Stop Control for Timer 2. 1: Start Timer 2 0: Stop Timer 2
1	C/T2	Timer or Counter Select (Timer 2) 1: External event counter falling edge triggered. 0: Internal Timer (OSC/12)
0	CP/RL2	Capture/Reload Select. 1: Capture of Timer 2 value into RCAP2H, RCAP2L is performed if EXEN2=1 and a negative transitions occurs on the T2EX pin. The capture mode requires RCLK and TCLK to be 0.  0: Auto-reload reloads will occur either with Timer 2 overflows or negative transitions at T2EX when EXEN2=1. When either RCK =1 or TCLK =1, this bit is ignored and the timer is forced to auto-reload on Timer 2 overflow.

The Timer 2 Mode selection bits and their function are described in the following table.

TABLE 29: TIMER 2 MODE SELECTION BITS

RCLK + TCLK	CP/RL2	TR2	MODE
0	0	1	16-bit Auto-Reload Mode
0	1	1	16-bit Capture Mode
1	X	1	Baud Rate Generator Mode
X	X	0	Timer 2 stops

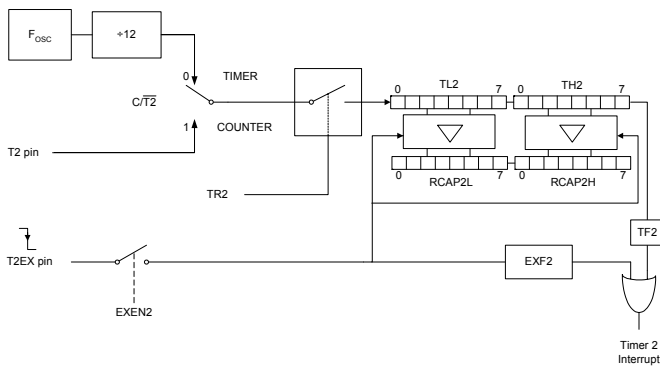

The modes are discussed in the following sections.

### Timer 2 Capture Mode

In Capture Mode, the EXEN2 bit of the T2CON register controls whether an external transition on the T2EX pin will trigger capture of the timer value.

When EXEN2 = 0, Timer 2 acts as a 16-bit timer or counter, which, upon overflowing, will set the TF2 bit (Timer 2 overflow bit). This overflow can be used to generate an interrupt.

FIGURE 13: TIMER 2 IN CAPTURE MODE

When EXEN2 = 1, the above still applies, however, in addition, it is possible to allow a 1 to 0 transition at the T2EX input to cause the current value stored in the Timer 2 registers (TL2 and TH2) to be captured into the RCAP2L and RCAP2H registers. Furthermore, the transition at T2EX causes bit EXF2 in T2CON to be set, and EXF2, like TF2, can generate an interrupt. Note that both EXF2 and TF2 share the same interrupt vector.

### Timer 2 Auto-Reload Mode

In this mode, there are also two options controlled by the EXEN2 bit in the T2CON register.

If EXEN2 = 0, when Timer 2 rolls over, it not only sets TF2, but also causes the Timer 2 registers to be reloaded with the 16-bit value in the RCAP2L and RCAP2H registers previously initialised. In this mode, Timer 2 can be used as a baud rate generator source for the serial port.

If EXEN2=1, Timer 2 still performs the above operation, however, additionally, a 1 to 0 transition at the external T2EX input will also trigger an anticipated reload of Timer 2 with the value stored in RCAP2L, RCAP2H and set EXF2.

FIGURE 14: TIMER 2 IN AUTO-RELOAD MODE

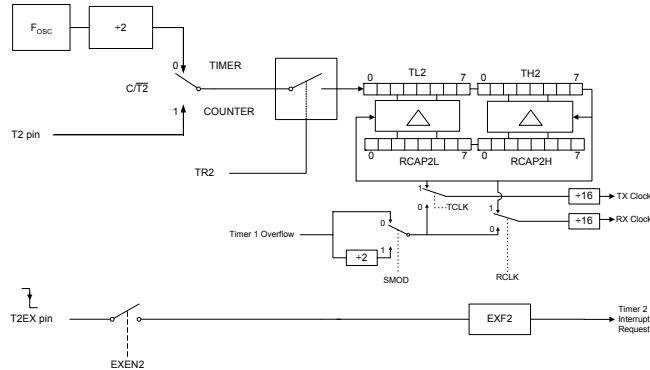

### Timer 2 Baud Rate Generator Mode

Timer 2 can be used for UART Baud Rate generation. This Mode is activated when RCLK is set to 1 and/or TCLK is set to 1. This Mode is described further in the serial port section.

FIGURE 15: TIMER 2 IN AUTOMATIC BAUD GENERATOR MODE

### UART Serial Port

The VRS51C1000's serial port can operate in full duplex mode (it can transmit and receive data simultaneously). This occurs at the same speed if one timer is assigned as the clock source for both transmission and reception, and at different speeds if transmission and reception are each controlled by their own timer.

The VRS51C1000 serial port includes a double buffer for the receiver, which allows reception of a byte even if the previously received one has not been retrieved from the receive register by the processor. However, if the first byte still has not been read by the time reception of the second byte is complete, the byte present in the receive buffer will be lost.

The SBUF register provides access to the transmit and receive registers of the serial port. Reading from the SBUF register will access the receive register, while a write to the SBUF loads the transmit register.

### Serial Port Control Register

The SCON (serial port control) register contains control and status information, and includes the 9<sup>th</sup> data bit for transmit/receive (TB8/RB8 if required), mode selection bits and serial port interrupt bits (TI and RI).

TABLE 30: SERIAL PORT CONTROL REGISTER (SCON) – SFR 98H

7	6	5	4	3	2	1	0
SM0	SM1	SM2	REN	TB8	RB8	TI	RI

Bit	Mnemonic	Description
7	SM0	Bit to select mode of operation (see table below)
6	SM1	Bit to select mode of operation (see table below)
5	SM2	Multiprocessor communication is possible in Modes 2 and 3.  In Modes 2 or 3 if SM2 is set to 1, RI will not be activated if the received 9 <sup>th</sup> data bit (RB8) is 0.  In Mode 1, if SM2 = 1 then RI will not be activated if a valid stop bit was not received.
4	REN	Serial Reception Enable Bit This bit must be set by software and cleared by software. 1: Serial reception enabled 0: Serial reception disabled
3	TB8	9 <sup>th</sup> data bit transmitted in Modes 2 and 3 This bit must be set by software and cleared by software.
2	RB8	9 <sup>th</sup> data bit received in Modes 2 and 3.  In Mode 1, if SM2 = 0, RB8 is the stop bit that was received. In Mode 0, this bit is not used. This bit must be cleared by software.
1	TI	Transmission Interrupt flag.  Automatically set to 1 when: <ul style="list-style-type: none"> <li>The 8<sup>th</sup> bit has been sent in Mode 0.</li> <li>Automatically set to 1 when the stop bit has been sent in the other modes.</li> </ul> This bit must be cleared by software.
0	RI	Reception Interrupt flag  Automatically set to 1 when: <ul style="list-style-type: none"> <li>The 8<sup>th</sup> bit has been received in Mode 0.</li> <li>Automatically set to 1 when the stop bit has been sent in the other modes (see SM2 exception).</li> </ul> This bit must be cleared by software.

TABLE 31: SERIAL PORT MODES OF OPERATION

SM0	SM1	Mode	Description	Baud Rate
0	0	0	Shift Register	$F_{osc}/12$
0	1	1	8-bit UART	Variable
1	0	2	9-bit UART	$F_{osc}/64$ or $F_{osc}/32$
1	1	3	9-bit UART	Variable

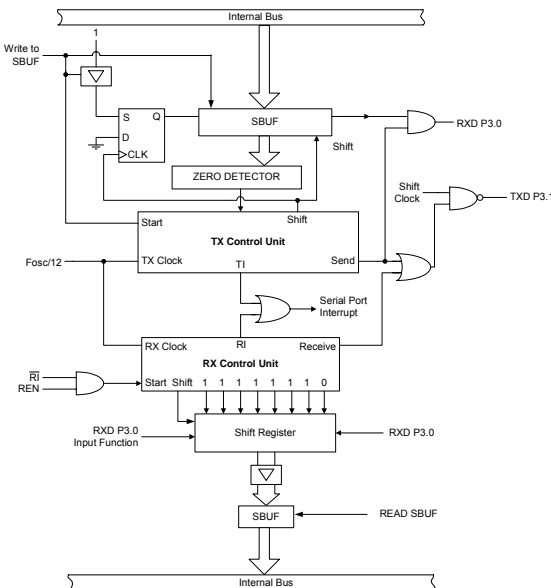

**UART Operating Modes**

The VRS51C1000’s serial port can operate in four different Modes. In all four Modes, a transmission is initiated by an instruction that uses the SBUF register as a destination register. In Mode 0, reception is initiated by setting RI to 0 and REN to 1. An incoming start bit initiates reception in the other modes, provided that REN is set to 1. The following paragraphs describe these four Modes.

**UART Operation in Mode 0**

In this Mode, the serial data exits and enters through the RXD pin. TXD is used to output the shift clock. The signal is composed of 8 data bits starting with the LSB. The baud rate in this mode is 1/12 the oscillator frequency.

FIGURE 16: SERIAL PORT MODE 0 BLOCK DIAGRAM

**UART Transmission in Mode 0**

Any instruction that uses SBUF as a destination register may initiate a transmission. The “write to SBUF” signal also loads a 1 into the 9<sup>th</sup> position of the transmit shift register and informs the TX control block to begin a transmission. The internal timing is such that one full machine cycle will elapse between a write to SBUF instruction and the activation of SEND.

The SEND signal enables the output of the shift register to the alternate output function line of P3.0 and enables SHIFT CLOCK to the alternate output function line of P3.1.

At every machine cycle in which SEND is active, the contents of the transmit shift register are shifted to the right by one position.

Zeros come in from the left as data bits shift out to the right. The TX control block sends its final shift and deactivates SEND while setting T1 after one condition is fulfilled. When the MSB of the data byte is at the output position of the shift register; the 1 that was initially loaded into the 9<sup>th</sup> position is just to the left of the MSB; and all positions to the left of that contain zeros. Once these conditions are met, the deactivation of SEND and the setting of T1 occurs at T1 of the 10<sup>th</sup> machine cycle after the “write to SBUF” pulse.

**UART Reception in Mode 0**

When REN and R1 are set to 1 and 0, respectively, reception is initiated. The bits 11111110 are written to the receive shift register at the end of the next machine cycle by the RX control unit. In the following phase, the RX control unit will activate RECEIVE.

The contents of the receive shift register are shifted one position to the left at the end of every machine cycle during which RECEIVE is active. The value that comes in from the right is the value that was sampled at the P3.0 pin.

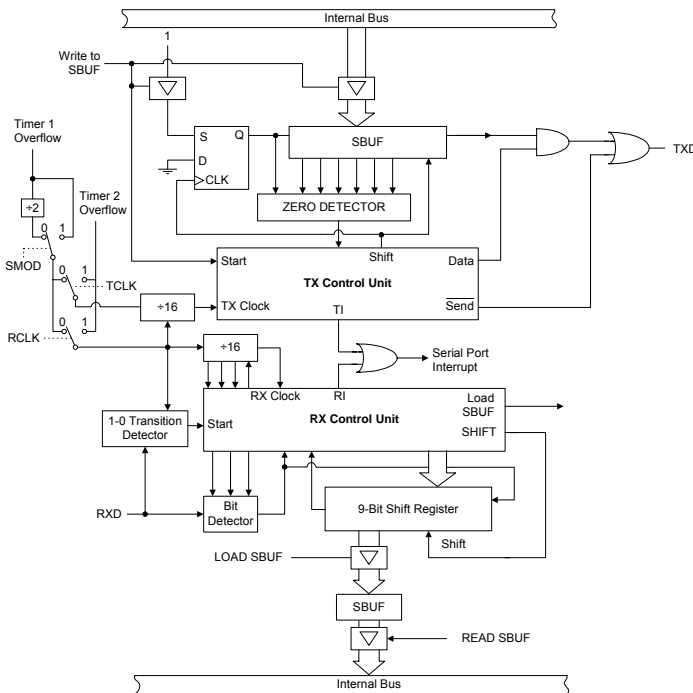

1’s are shifted out to the left as data bits are shifted in from the right. The RX control block is flagged to do one last shift and load SBUF when the 0 that was initially loaded into the rightmost position arrives at the leftmost position in the shift register.

### UART Operation in Mode 1

In Mode 1 operation, 10 bits are transmitted (through TXD) or received (through RXD). The transactions are composed of: a Start bit (Low); 8 data bits (LSB first) and one Stop bit (high). The reception is completed once the Stop bit sets the RB8 flag in the SCON register. Either Timer 1 or Timer 2 controls the baud rate in this mode.

The following diagram shows the serial port structure when configured in Mode 1.

FIGURE 17: SERIAL PORT MODE 1 AND 3 BLOCK DIAGRAM

### UART Transmission in Mode 1

Transmission in this mode is initiated by any instruction that makes use of SBUF as a destination register. The 9<sup>th</sup> bit position of the transmit shift register is loaded by the “write to SBUF” signal. This event also flags/informs the TX Control Unit that a transmission has been requested.

It is after the next rollover in the divide-by-16 counter when transmission actually begins. It follows that the bit times are synchronized to the divide-by-16 counter and not to the “write to SBUF” signal.

When a transmission begins, it places the start bit at TXD. Data transmission is activated one bit time later. This activation enables the output bit of the transmit shift register to TXD. One bit time after that, the first shift pulse occurs.

In this Mode, zeros are clocked in from the left as data bits are shifted out to the right. When the most significant bit of the data byte is at the output position of the shift register, the 1 that was initially loaded into the 9<sup>th</sup> position is to the immediate left of the MSB, and all positions to the left of that contain zeros. This condition flags the TX Control Unit to shift one more time.

### UART Reception in Mode 1

A one to zero transition at pin RXD will initiate reception. It is for this reason that RXD is sampled at a rate of 16 multiplied by the baud rate that has been established. When a transition is detected, 1FFh is written into the input shift register and the divide-by-16 counter is immediately reset. The divide-by-16 counter is reset in order to align its rollovers with the boundaries of the incoming bit times.

In total, there are 16 states in the counter. During the 7<sup>th</sup>, 8<sup>th</sup> and 9<sup>th</sup> counter states of each bit time; the bit detector samples the value of RXD. The accepted value is the value that was seen in at least two of the three samples. The purpose of doing this is for noise rejection. If the value accepted during the first bit time is not zero, the receive circuits are reset and the unit goes back to searching for another one to zero transition. All false start bits are rejected by doing this. If the start bit is valid, it is shifted into the input shift register, and the reception of the rest of the frame will proceed.

For a receive operation, the data bits come in from the right as 1’s shift out on the left. As soon as the start bit arrives at the leftmost position in the shift register, (9-

bit register), it causes the UART's receive controller block to perform one last shift operation: to set RI and to load SBUF and RB8. The signal to load SBUF and RB8, and to set RI, will be generated if, and only if, the following conditions are met at the time the final shift pulse is generated:

- o Either SM2 = 0 or the received stop bit = 1
- o RI = 0

If both conditions are met, the stop bit goes into RB8, the 8 data bits go into SBUF, and RI is activated. If one of these conditions is not met, the received frame is completely lost. At this time, whether the above conditions are met or not, the unit goes back to searching for a one to zero transition in RXD.

**UART Operation in Mode 2**

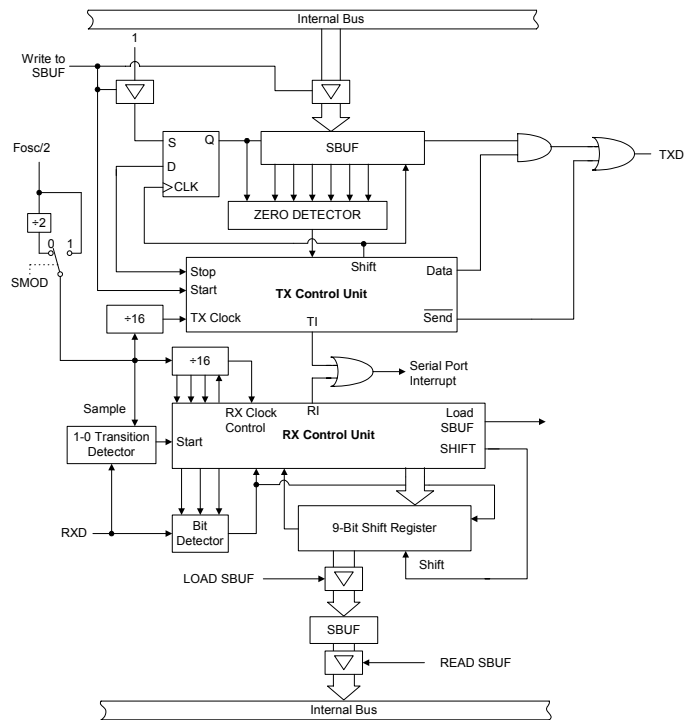

In Mode 2 a total of 11 bits are transmitted (through TXD) or received (through RXD). The transactions are composed of: a Start bit (Low), 8 data bits (LSB first), a programmable 9<sup>th</sup> data bit, and one Stop bit (High).

For transmission, the 9<sup>th</sup> data bit comes from the TB8 bit of SCON. For example, the parity bit P in the PSW could be moved into TB8.

In the case of receive, the 9<sup>th</sup> data bit is automatically written into RB8 of the SCON register.

In Mode 2, the baud rate is programmable to either 1/32 or 1/64 the oscillator frequency.

FIGURE 18: SERIAL PORT MODE 2 BLOCK DIAGRAM

### UART Operation in Mode 3

In Mode 3, 11 bits are transmitted (through TXD) or received (through RXD). The transactions are composed of: a Start bit (Low), 8 data bits (LSB first), a programmable 9<sup>th</sup> data bit, and one Stop bit (High).

Mode 3 is identical to Mode 2 in all respects but one: the baud rate. Either Timer 1 or Timer 2 generates the baud rate in Mode 3.

FIGURE 19: SERIAL PORT MODE 3 BLOCK DIAGRAM

### UART in Mode 2 and 3: Additional Information

As mentioned previously, for an operation in Modes 2 and 3, 11 bits are transmitted (through TXD) or received (through RXD). The signal comprises: a logical low Start bit, 8 data bits (LSB first), a programmable 9<sup>th</sup> data bit, and one logical high Stop bit.

On transmit, (TB8 in SCON) can be assigned the value of 0 or 1. On receive; the 9<sup>th</sup> data bit goes into RB8 in SCON. The baud rate is programmable to either 1/32 or 1/64 the oscillator frequency in Mode 2. Mode 3 may have a variable baud rate generated from either Timer 1 or Timer 2 depending on the states of TCLK and RCLK.

### UART Transmission in Mode 2 and Mode 3

The transmission is initiated by any instruction that makes use of SBUF as the destination register. The 9<sup>th</sup> bit position of the transmit shift register is loaded by the “write to SBUF” signal. This event also informs the UART transmission control unit that a transmission has been requested. After the next rollover in the divide-by-16 counter, a transmission actually starts at the beginning of the machine cycle. It follows that the bit times are synchronized to the divide-by-16 counter and not to the “write to SBUF” signal, as in the previous mode.

Transmissions begin when the SEND signal is activated, which places the Start bit on TXD pin. Data is activated one bit time later. This activation enables the output bit of the transmit shift register to the TXD pin. The first shift pulse occurs one bit time after that.

The first shift clocks a Stop bit (1) into the 9<sup>th</sup> bit position of the shift register on TXD. Thereafter, only zeros are clocked in. Thus, as data bits shift out to the right, zeros are clocked in from the left. When TB8 is at the output position of the shift register, the stop bit is just to the left of TB8, and all positions to the left of that contain zeros. This condition signals to the TX control unit to shift one more time and set TI, while deactivating SEND. This occurs at the 11<sup>th</sup> divide-by-16 rollover after “write to SBUF”.

### UART Reception in Mode 2 and Mode 3

One to zero transitions on the RXD pin initiate reception. It is for this reason that RXD is sampled at a rate of 16 multiplied by the baud rate that has been established.

When a transition is detected, the 1FFh is written into the input shift register and the divide-by-16 counter is immediately reset.

During the 7<sup>th</sup>, 8<sup>th</sup> and 9<sup>th</sup> counter states of each bit time; the bit detector samples the value of RXD. The accepted value is the value that was seen in at least two of the three samples. If the value accepted during the first bit time is not zero, the receive circuits are reset and the unit goes back to searching for another one to zero transition. If the start bit is valid, it is shifted into the input shift register, and the reception of the rest of the frame will proceed.

For a receive operation, the data bits come in from the right as 1's shift out on the left. As soon as the start bit arrives at the leftmost position in the shift register (9-bit register), it tells the RX control block to do one more shift, to set RI, and to load SBUF and RB8. The signal to set RI and to load SBUF and RB8 will be generated if, and only if, the following conditions are satisfied at the instance when the final shift pulse is generated:

- Either SM2 = 0 or the received 9<sup>th</sup> bit equal 1
- RI = 0

If both conditions are met, the 9<sup>th</sup> data bit received goes into RB8, and the first 8 data bits go into SBUF. If one of these conditions is not met, the received frame is completely lost. One bit time later, whether the above conditions are met or not, the unit goes back to searching for a one to zero transition at the RXD input. Please note that the value of the received stop bit is unrelated to SBUF, RB8 or RI.

### UART Baud Rates

In Mode 0, the baud rate is fixed and can be represented by the following formula:

$$\text{Mode 0 Baud Rate} = \frac{\text{Oscillator Frequency}}{12}$$

In Mode 2, the baud rate depends on the value of the SMOD bit in the PCON SFR. From the formula below, we can see that if SMOD = 0 (which is the value on reset), the baud rate is 1/32 the oscillator frequency.

$$\text{Mode 2 Baud Rate} = \frac{2^{\text{SMOD}} \times (\text{Oscillator Frequency})}{64}$$

The Timer 1 and/or Timer 2 overflow rate determines the baud rates in Modes 1 and 3.

### Generating UART Baud Rate with Timer 1

When Timer 1 functions as a baud rate generator, the baud rate in Modes 1 and 3 are determined by the Timer 1 overflow rate.

$$\text{Mode 1,3 Baud Rate} = \frac{2^{\text{SMOD}} \times \text{Timer 1 Overflow Rate}}{32}$$

Timer 1 must be configured as an 8-bit timer (TL1) with auto-reload with TH1 value when an overflow occurs (Mode 2). In this application, the Timer 1 interrupt should be disabled.

The two following formulas can be used to calculate the baud rate and the reload value to be written into the TH1 register.

$$\text{Mode 1,3 Baud Rate} = \frac{2^{\text{SMOD}} \times F_{\text{osc}}}{32 \times 12(256 - \text{TH1})}$$

The value to write into the TH1 register is defined by the following formula:

$$TH1 = 256 - \frac{2^{SMOD} \times F_{osc}}{32 \times 12 \times (\text{Baud Rate})}$$

### Generating UART Baud Rates with Timer 2

Timer 2 is often preferred to generate the baud rate, as it can be easily configured to operate as a 16-bit timer with auto-reload. This allows for much better resolution than using Timer 1 in 8-bit auto-reload mode.

The baud rate using Timer 2 is defined as:

$$\text{Mode 1,3 Baud Rate} = \frac{\text{Timer 2 Overflow Rate}}{16}$$

The timer can be configured as either a timer or a counter in any of its 3 running modes. In most typical applications, it is configured as a timer (C/T2 is set to 0).

To make the Timer 2 operate as a baud rate generator, the TCLK and RCLK bits of the T2CON register must be set to 1.

The baud rate generator mode is similar to the auto-reload mode in that an overflow in TH2 causes the Timer 2 registers to be reloaded with the 16-bit value in registers RCAP2H and RCAP2L, which are preset by software. However, when Timer 2 is configured as a baud rate generator, its clock source is  $Osc/2$ .

The following formula can be used to calculate the baud rate in modes 1 and 3 using the Timer 2:

$$\text{Modes 1, 3 Baud Rate} = \frac{\text{Oscillator Frequency}}{32 \times [65536 - (\text{RCAP2H}, \text{RCAP2L})]}$$

The formula below is used to define the reload value to put into the RCAP2h, RCAP2L registers to achieve a given baud rate.

$$(\text{RCAP2H}, \text{RCAP2L}) = 65536 - \frac{F_{osc}}{32 \times [\text{Baud Rate}]}$$

In the above formula, RCAP2H and RCAP2L are the content of RCAP2H and RCAP2L taken as a 16-bit unsigned integer.

Note that a rollover in TH2 does not set TF2, and will not generate an interrupt and because of this, Timer 2 interrupt does not have to be disabled when Timer 2 is configured in baud rate generator mode.

Furthermore, when Timer 2 is configured as UART baud rate generator and running (TR2 is set to 1), the user should not try to perform read or write operations to the TH2 or TL2 and RCAP2H, RCAP2L registers

**Timer 1 Reload Value in Modes 1 & 3 for UART Baud Rate**

The following table provides examples of Timer 1, 8-bit reload value when used as a UART Baud Rate generator and the SMOD bit of the PCON register is set to 1.

	22.184MHz	16.000MHz	14.745MHz	12.000MHz	11.059MHz	8.000MHz	3.57MHz

```

### Interrupts

The VRS51C1000 has 8 interrupt sources (9 if we include the WDT) and 7 interrupt vectors (including reset) for handling.

The interrupts are enabled via the IE register shown below:

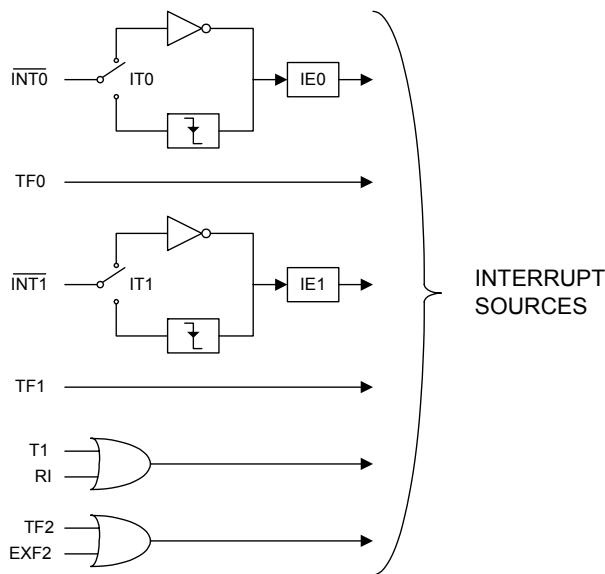

TABLE 32: IE INTERRUPT ENABLE REGISTER –SFR A8h

7	6	5	4	3	2	1	0
EA	-	ET2	ES	ET1	EX1	ET0	EX0

Bit	Mnemonic	Description
7	EA	Disables All Interrupts 0: no interrupt acknowledgment  1: Each interrupt source is individually enabled or disabled by setting or clearing its enable bit.
6	-	Reserved
5	ET2	Timer 2 Interrupt Enable Bit
4	ES	Serial Port Interrupt Enable Bit
3	ET1	Timer 1 Interrupt Enable Bit
2	EX1	External Interrupt 1 Enable Bit
1	ET0	Timer 0 Interrupt Enable Bit
0	EX0	External Interrupt 0 Enable Bit

The following figure illustrates the various interrupt sources on the VRS51C1000.

FIGURE 20: INTERRUPT SOURCES

### Interrupt Vectors

The following table specifies each interrupt source, its flag and its vector address.

TABLE 33: INTERRUPT VECTOR ADDRESS

Interrupt Source	Flag	Vector Address
RESET (+ WDT)	WDR	0000h*
INT0	IE0	0003h
Timer 0	TF0	000Bh
INT1	IE1	0013h
Timer 1	TF1	001Bh
Serial Port	RI+TI	0023h
Timer 2	TF2+EXF2	002Bh

\*If location 0000h = FFh, the PC jump to the ISP program.

### External Interrupts

The VRS51C1000 has two external interrupt inputs (INT0 and INT1). These interrupt lines are shared with the P3.2 and P3.3 I/Os.

Bits IT0 and IT1 of the TCON register determine whether the external interrupts are level or edge sensitive.

If ITx = 1, the interrupt will be raised when a 1 to 0 transition occurs at the interrupt pin. The duration of the transition must be at least equal to 12 oscillator cycles.

If ITx = 0, the interrupt will occur when a logic low condition is present on the interrupt pin.

The state of the external interrupt, when enabled, can be monitored using the flags, IE0 and IE1 of the TCON register and will be set when the interrupt condition occurs.

In the case where the interrupt was configured as edge sensitive, the associated flag is automatically cleared when the interrupt is serviced.

If the interrupt is configured as level sensitive, then the interrupt flag must be cleared by the software.

**Timer 0 and Timer 1 Interrupt**

Both Timer 0 and Timer 1 can be configured to generate an interrupt when a rollover of the timer/counter occurs (except Timer 0 in Mode 3).

The TF0 and TF1 flags serve to monitor timer overflow occurring in Timer 0 and Timer 1. These interrupt flags are automatically cleared when the interrupt is serviced.

**Timer 2 interrupt**

A Timer 2 interrupt can occur if TF2 and/or EXF2 flags are set to 1 and if the Timer 2 interrupt is enabled.

The TF2 flag is set when a rollover of the Timer 2 Counter/Timer occurs. The EXF2 flag can be set by a 1 to 0 transition on the T2EX pin by the software.

Note that neither flag is cleared by the hardware upon execution of the interrupt service routine. The service routine may have to determine whether it was TF2 or EXF2 that generated the interrupt. These flag bits will have to be cleared by the software.

Every bit that generates interrupts can either be cleared or set by the software, yielding the same result as when the operation is done by the hardware. In other words, pending interrupts can be cancelled and interrupts can be generated by the software.

**Serial Port Interrupt**

The serial port can generate an interrupt upon byte reception or once the byte transmission is completed.

Those two conditions share the same interrupt vector and it is up to the user developed interrupt service routine software to ascertain the cause of the interrupt by looking at the serial interrupt flags RI and TI.

Note that neither of these flags are cleared by the hardware upon execution of the interrupt service routine. The software must clear these flags.

**Execution of an Interrupt**

When the processor receives an interrupt request, an automatic jump to the desired subroutine occurs. This jump is similar to executing a branch to a subroutine instruction: the processor automatically saves the address of the next instruction on the stack. An internal flag is set to indicate that an interrupt is taking place, and then the jump instruction is executed. An interrupt subroutine must always end with the RETI instruction. This instruction allows users to retrieve the return address placed on the stack.

The RETI instruction also allows updating of the internal flag that will take into account an interrupt with the same priority.

**Interrupt Enable and Interrupt Priority**

When the VRS51C1000 is initialized, all interrupt sources are inhibited by the bits of the IE register being reset to 0. It is necessary to start by enabling the interrupt sources that the application requires. This is achieved by setting bits in the IE register, as discussed previously.

This register is part of the bit addressable internal SRAM. For this reason, it is possible to modify each bit individually in one instruction without having to modify the other bits of the register. All interrupts can be inhibited by setting EA to 0.

The order in which interrupts are serviced is shown in the following table:

TABLE 34: INTERRUPT PRIORITY

<b>Interrupt Source</b>
RESET + WDT (Highest Priority)
IE0
TF0
IE1
TF1
RI+TI
TF2+EXF2 (Lowest Priority)

**Modifying the Order of Priority**

The VRS51C1000 allows the user to modify the natural priority of the interrupts. One may modify the order by programming the bits in the IP (Interrupt Priority) register. When any bit in this register is set to 1, it gives the corresponding source a greater priority than interrupts coming from sources that don't have their corresponding IP bit set to 1.

The IP register is represented in the table below.

TABLE 35: IP INTERRUPT PRIORITY REGISTER –SFR B8H

7	6	5	4	3	2	1	0
EA	-	ET2	ES	ET1	EX1	ET0	EX0

Bit	Mnemonic	Description
7	-	
6	-	
5	PT2	Gives Timer 2 Interrupt Higher Priority
4	PS	Gives Serial Port Interrupt Higher Priority
3	PT1	Gives Timer 1 Interrupt Higher Priority
2	PX1	Gives INT1 Interrupt Higher Priority
1	PT0	Gives Timer 0 Interrupt Higher Priority
0	PX0	Gives INT0 Interrupt Higher Priority

**Watchdog Timer**

The Watchdog Timer (WDT) is a 16-bit free-running counter that generates a reset signal if the counter overflows. The WDT is useful for systems that are susceptible to noise, power glitches and other conditions that can cause the software to go into infinite dead loops or runaways. The WDT function gives the user software a recovery mechanism from abnormal software conditions. The WDT is different from Timer 0, Timer 1 and Timer 2 of the standard 8051.

Once the WDT is enabled, the user software must clear it periodically. In the case where the WDT is not cleared, its overflow will trigger a reset of the VRS51C1000.

The user should check the WDR bit of the SYSCON register whenever an unpredicted reset has taken place.

The WDT timeout delay can be adjusted by configuring the clock divider input for the time base source clock of the WDT. To select the divider value, bit2-bit0 (PS2-PS0) of the Watchdog Timer Control Register (WDTC) should be set accordingly.

To enable the WDT, the user must set bit 7 (WDTE) of the WDTC register to 1. Once WDTE has been set to 1, the 16-bit counter will start to count with the selected time base source clock configured in PS2~PS0. The

Watchdog Timer will generate a reset signal if an overflow has taken place. The WDTE bit will be cleared to 0 automatically when VRS51C1000 has been reset by either the hardware or a WDT reset. Clearing the WDT is accomplished by setting the CLR bit of the WDTC to 1. This action will clear the contents of the 16-bit counter and force it to restart.

**Watchdog Timer Registers**

Two of the registers of the VRS51C1000 are associated with the Watchdog Timer: WDTC and SYSCON. The WDTC register allows the user to enable the WDT, clear the counter and to divide the clock source. The WDR bit of the SYSCON register indicates whether the Watchdog Timer caused the device reset.

TABLE 36: WATCHDOG TIMER REGISTERS: WDTC – SFR 9FH

7	6	5	4	3	2	1	0
WDTE	Unused	CLR	Unused	PS2	PS1	PS0	

Bit	Mnemonic	Description
7	WDTE	Watchdog Timer Enable Bit
6	Unused	-
5	CLR	Watchdog Timer Counter Clear Bit
[4:3]	Unused	-
2	PS2	Clock Source Divider Bit 2
1	PS1	Clock Source Divider Bit 1
0	PS0	Clock Source Divider Bit 0

The following table provides timeout periods associated with different values of the PSx bits of the Watchdog Timer Register.

TABLE 37: TIME PERIOD AT 40MHZ, 22.184MHZ AND 11.059MHZ

PS [2:0]	Divider (OSC in)	WDT Period 40MHz	WDT Period 22.18MHz	WDT Period 12MHz
000	8	13.11	23.63	43.69
001	16	26.21	47.27	87.38
010	32	52.43	94.53	174.76
011	64	104.86	189.07	349.53
100	128	209.72	378.14	699.05
101	256	419.43	756.28	1398.10
110	512	838.86	1512.55	2796.20
111	1024	1677.72	3025.10	5592.41

TABLE 38: WATCHDOG TIMER REGISTER-SYSTEM CONTROL REGISTER (SYSCON)-SFR BFH

7	6	5	4	3	2	1	0
WDR	Unused			IAPE	XRAME	ALEI	

Bit	Mnemonic	Description
7	WDR	Watchdog Timer Reset Bit
[6:3]	Unused	-
2	IAPE	ISP Overall Enable Bit 1: Enables ISP Function 0: Disables ISP Function
1	XRAME	
0	ALEI	1: Enable Electromagnetic Interference Reducer 0: Disable Electromagnetic Interference Reducer

As previously mentioned, bit 7 (WDR) of SYSCON is the Watchdog Timer Reset bit. It will be set to 1 when a reset signal is generated by the WDT overflow. The user should check the WDR bit whenever an unpredicted reset has taken place.

**Reduced EMI Function**

The VRS51C1000 can also be set up for reduced EMI (electromagnetic interference) by setting bit 0 (ALEI) of the SYSCON register to 1. This function will inhibit the Fosc/6Hz clock signal output to the ALE pin.

**Pulse Width Modulation (PWM)**

The Pulse Width Modulation (PWM) module consists of five 8-bit channels. Each channel uses an 8-bit PWM data register (PWMD) to set the number of continuous pulses within a PWM frame cycle.

**PWM Function Description:**

Each 8-bit PWM channel is composed of an 8-bit register that consists of a 5-bit PWM (5 MSBs) and a 3-bit (LSBs) Narrow Pulse Generator (NP). The 5-bit PWM determines the duty cycle of the output. The 3-bit NPx generates and inserts narrow pulses among the PWM frame made of 8 cycles.

The number of pulses generated is equal to the number programmed into the 3-bit NP. The NP is used to generate an equivalent 8-bit resolution PWM type DAC with a reasonably high repetition rate through a 5-bit PWM clock speed. The PDCK[1:0] settings of the PWMC (A3h) register is used to derive the PWM clock from Fosc.

$$PWM\ Clock = \frac{F_{osc}}{2^{(PDCK\ [1:0] + 1)}}$$

The PWM output cycle frame repetition rate (frequency) is calculated using the following formula:

$$PWM\ Clock = \frac{F_{osc}}{32 \times 2^{(PDCK\ [1:0] + 1)}}$$

**PWM Registers - Port1 Configuration Register**

TABLE 39: PORT1 CONFIGURATION REGISTER (PWME, \$9B)

7	6	5	4
PWM4E	PWM3E	PWM2E	PWM1E

N = NP[4:0][2:0]	Number of PWM cycles inserted in an 8-cycle frame
XX1	1
X1X	2
1XX	3

Example of PWM Timing Diagram

```
MOV PWMD0 #83H      ; PWMD04:0]=10h (=16T high, 16T low), NP02:0] = 3
MOV PWME, #08H     ; Enable P1.3 as PWM output pin
```

FIGURE 21: PWM TIMING DIAGRAM

If  $F_{osc} = 20\text{MHz}$ ,  $PDCK[1:0]$  of  $PWMC = \#03H$ , then  $PWM\ clock = 20\text{MHz} / 2^4 = 20\text{MHz} / 16 = 1.25\text{MHz}$ .  $PWM\ output\ cycle\ frame\ frequency = (20\text{MHz} / 2^4) / 32 = 39.1\text{ kHz}$ .

## Crystal consideration

The crystal connected to the VRS51C1000 oscillator input should be of a parallel type, operating in fundamental mode.

The following table provides suggested capacitor and resistor feedback values for different operating frequencies.

Valid for VRS51C1000				
XTAL	3MHz	6MHz	9MHz	12MHz
C1	30 pF	30 pF	30 pF	30 pF
C2	30 pF	30 pF	30 pF	30 pF
R	open	open	open	open
XTAL	16MHz	25MHz	33MHz	40MHz
C1	30 pF	15 pF	10 pF	2 pF
C2	30 pF	15 pF	10 pF	2 pF
R	open	62KΩ	6.8KΩ	4.7KΩ

**Note:** Oscillator circuits may differ with different crystals or ceramic resonators in higher oscillator frequencies.

Crystals or ceramic resonator characteristics vary from one manufacturer to the other.

The user should check the specific crystal or ceramic resonator technical literature available or contact the manufacturer to select the appropriate values for the external components.

## Operating Conditions

TABLE 46: OPERATING CONDITIONS

Symbol	Description	Min.	Typ.	Max.	Unit	Remarks
TA	Operating temperature	-40	25	+85	°C	Ambient temperature under bias
TS	Storage temperature	-55	25	155	°C	
VCC5	Supply voltage	4.5	5.0	5.5	V	
Fosc 40	Oscillator Frequency	3.0	-	40	MHz	For 5V application

## DC Characteristics

TABLE 47: DC CHARACTERISTICS

Symbol	Parameter	Valid	Min.	Max.	Unit	Test Conditions
VIL1	Input Low Voltage	Port 0, 1, 2, 3, 4, #EA	-0.5	1.0	V	VCC=5V
VIL2	Input Low Voltage	RES, XTAL1	0	0.8	V	VCC=5V
VIH1	Input High Voltage	Port 0, 1, 2, 3, 4, #EA	2.0	VCC+0.5	V	VCC=5V
VIH2	Input High Voltage	RES, XTAL1	70% VCC	VCC+0.5	V	VCC=5V
VOL1	Output Low Voltage	Port 0, ALE, #PSEN		0.45	V	IOL=3.2mA
VOL2	Output Low Voltage	Port 1, 2, 3, 4		0.45	V	IOL=1.6mA
VOH1	Output High Voltage	Port 0	2.4		V	IOH=-800uA
			90%VCC		V	IOH=-80uA
VOH2	Output High Voltage	Port 1, 2, 3, 4, ALE, #PSEN	2.4		V	IOH=-60uA
			90% VCC		V	IOH=-10uA
IIL	Logical 0 Input Current	Port 1, 2, 3, 4		-75	uA	Vin=0.45V
ITL	Logical Transition Current	Port 1, 2, 3, 4		-650	uA	Vin=2.0V
ILI	Input Leakage Current	Port 0, #EA		±10	uA	0.45V<Vin<VCC
R RES	Reset Pull-down Resistance	RES	50	300	Kohm	
C <sub>10</sub>	Pin Capacitance			10	pF	Fre=1 MHz, Ta=25°C
ICC	Power Supply Current	VDD		20	mA	Active mode, 40MHz
				15	mA	Active mode 25MHz
				10	mA	Active mode 16MHz
				10	mA	Idle mode, 40MHz
				7.5	mA	Idle mode 25MHz
				6	mA	Idle mode, 16MHz
				150	uA	Power down mode

**Plastic Chip Carrier (PLCC-44)**

**Note:**

1. Dimensions D & E do not include interlead Flash.
2. Dimension B1 does not include dambar protrusion/intrusion.
3. Controlling dimension: Inch
4. General appearance spec should be based on final visual inspection spec.

TABLE 49: DIMENSIONS OF PLCC-44 CHIP CARRIER

Symbol	Dimension in inch	Dimension in mm
	Minimal/Maximal	Minimal/Maximal
A	-/0.185	-/4.70
A1	0.020/-	0.51/
A2	0.145/0.155	3.68/3.94
b1	0.026/0.032	0.66/0.81

R2	0.005/0.012	0.13/0.30
S	0.008/-	0.20/-
$\theta$	$0^{\circ}/7^{\circ}$	as left
$\theta 1$	$0^{\circ}$ -	as left
$\theta 2$	$10^{\circ}$ REF	as left
$\theta 3$	$7^{\circ}$ REF	as left
$\Delta C$	0.004	0.10

**Note:**

1. Dimensions D1 and E1 do not include mold protrusion.
2. Allowance protrusion is 0.25mm per side.
3. Dimensions D1 and E1 do not include mold mismatch and are determined datum plane.
4. Dimension b does not include dambar protrusion.
5. Allowance dambar protrusion shall be 0.08 mm total in excess of the b dimension at maximum material condition. Dambar cannot be located on the lower radius of the lead foot.

## Ordering Information

### Device Number Structure

### VRS51C1000 Ordering Options (No ISPV2 Firmware preprogrammed)

Device Number	Flash Size	SRAM Size	Package Option	Voltage	Temperature	Frequency
VRS51C1000-40-L	64KB	1KB	PLCC-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-Q	64KB	1KB	QFP-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-P	64KB	1KB	DIP-40	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-LG	64KB	1KB	PLCC-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-QG	64KB	1KB	QFP-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-PG	64KB	1KB	DIP-40	4.5V to 5.5V	-40°C to +85°C	40MHz

### VRS51C1000 Ordering Options (With ISPV2 Firmware preprogrammed)

Device Number	Flash Size	SRAM Size	Package Option	Voltage	Temperature	Frequency
VRS51C1000-40-L-ISPV2	64KB	1KB	PLCC-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-Q-ISPV2	64KB	1KB	QFP-44	4.5V to 5.5V	-40°C to +85°C	40MHz
VRS51C1000-40-P-ISPV2	64KB	1KB	DIP-40	4.5V to 5.5V	-40°C to +85°C	40MHz
