

MITSUBISHI <LINEAR ICs>
M51205TL,FP

VOLTAGE COMPARATOR

DESCRIPTION

The M51205 is a semiconductor integrated circuit for a voltage comparator that operates from a single power supply. Especially the M51205 has superiority as to characteristics of input current (high input resistance) and fits to wide ranged applications, for example CR timer, etc. M51205TL, FP's package is a mini SIP and FLAT package, therefore can use very easily.

FEATURES

- Low input current (high input resistance) 15nA(typ.)
- Built-in zener diode for stabilization of supply voltage between supply voltage terminal and GND terminal 5.6V(typ.)
- Capable of directly driving a relay or a lamp
- Including reference voltage for comparison
- Hysteresis between input and output
- High output breakdown voltage 30V(max.)

APPLICATION

Electric shutter, CR timer, voltage comparator, time delay circuit, oscillator (square wave)

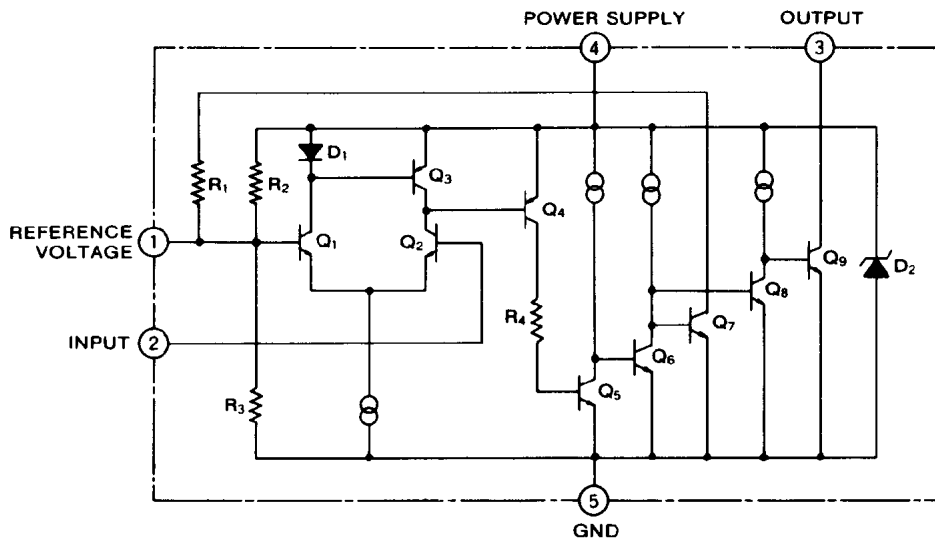

RECOMMENDED OPERATING CONDITION

Rated supply voltage 12V($R_d=1k\Omega$)

PRECAUTIONS FOR USE

1. Paying much attention is necessary for fear that the M51205TL,FP may flow large current and reach to destroy because of the structure when the terminals of V_{CC} and GND of the M51205TL,FP is connected wrong position each other.
2. Output is "open collector" and a loading resistor is not included. Connect a loading resistor to stabilize operation, in case of driving a next stage.
3. Care should be taken not to apply over 5(V) directly to the terminals between Pin ④ and Pin ⑤. Connect a dropper resistor (R_d) in series to Pin ④, in case of applying over 5(V) between Pin ④ and Pin ⑤.
