

## All Band TV Tuner IC with On-chip PLL

**Description**

The CXA3235/3236N is a monolithic TV tuner IC which integrates local oscillator and mixer circuits for VHF band, local oscillator and mixer circuits for UHF band, an IF amplifier and a tuning PLL onto a single chip, enabling further miniaturization of the tuner. The PLL on this IC supports the I<sup>2</sup>C bus format.

**Features**

- Low noise figure
- Low power consumption (5 V, 54 mA typ.)
- On-chip tuning PLL (I<sup>2</sup>C bus format)
- Selection of frequency steps 31.25 kHz, 50 kHz and 62.5 kHz
- On-chip 4-output band switch

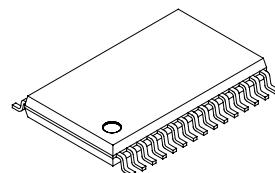

**Applications**

- TV tuners
- VCR tuners
- CATV tuners

## Electrical Characteristics Measurement Circuit

### Description of Functions

The CXA3235/3236N is a terrestrial wave broadcast tuner IC which converts frequencies to IF in order to tune and detect only the desired reception frequency of VHF, CATV and UHF band signals.

In addition to the mixer, local oscillator and IF amplifier circuits required for frequency conversion to IF, this IC also integrates a PLL circuit for local oscillator frequency control onto a single chip.

The functions of the various circuits are described below.

#### 1. Mixer circuit

This circuit outputs the frequency difference between the signal input to VHFIN or UHFIN and the local oscillation signal.

#### 2. Local oscillator circuit

A VCO is formed by externally connecting an LC resonance circuit composed of a varicap diode and inductance.

#### 3. IF amplifier circuit

This circuit amplifies the mixer IF output, and consists of an amplifier stage and low impedance output stage.

#### 4. PLL circuit

This PLL circuit fixes the local oscillator frequency to the desired frequency. It consists of a prescaler, main divider, reference divider, phase comparator, charge pump and reference oscillator. The control format supports the I<sup>2</sup>C bus format. The following five modes can be selected according to the combination of the frequency division values of the main and reference dividers.

Mode	Main divider	Reference divider
B-0	15 bit	1024 fixed
B-1	14 bit	512 fixed
B-2	15 bit	640 fixed
B-3	15 bit	512 fixed
B-4	15 bit	512/1024 switching

**Description of Analog Block Operation**

(See the Electrical Characteristics Measurement Circuit.)

**VHF oscillator circuit**

- This circuit is a differential amplifier type oscillator circuit. Pin 18 is the output and Pin 16 is the input. Oscillation is performed by connecting an LC resonance circuit including a varicap to Pin 18 via coupled capacitance, inputting to Pin 16 with feedback capacitance, and applying positive feedback.
- The amplifier between Pins 16 and 18 has an extremely high gain. Therefore, care should be taken to avoid creating parasitic capacitance, resistance or other feedback loops as this may produce abnormal oscillation.

**VHF mixer circuit**

- The mixer circuit employs a double balance mixer with little local oscillation signal leakage. The input format is base input type, with Pin 12 grounded and the RF signal input to Pin 13.
- The RF signal is inserted from the oscillator, converted to IF frequency and output from Pins 9 and 10.
- Pins 9 and 10 are open collectors, so power must be supplied externally. The electric potential of Pins 9 and 10 at this time must be DC 4.0 V or more.

**UHF oscillator circuit**

- This oscillator circuit is designed so that two collector ground type Colpitts oscillators perform differential oscillation operation via an LC resonance circuit including a varicap. Connect resonator capacitance composing colpitts oscillators between Pins 19 and 20, Pins 20 and 21, and Pins 21 and 22.
- Then, LC resonance circuit comprising a varicap diode is connected across Pins 19 and 22.

**UHF mixer circuit**

- This circuit employs a double balance mixer like the VHF mixer circuit. The input format is base input type, with Pins 14 and 15 as the RF input pins. The input method can be selected from balanced input consisting of differential input to Pins 14 and 15 or unbalanced input consisting of grounding Pin 14 via a capacitor and input to Pin 15.
- Pins 9 and 10 are the mixer outputs.
- Pins 9 and 10 are open collectors, so power must be supplied externally. The electric potential of Pins 9 and 10 at this time must be DC 4.0 V or more.

**IF amplifier circuit**

- The signals frequency converted by the mixer are output from Pins 9 and 10, and at the same time are AC coupled inside the IC and input to the IF amplifier.
- Single-tuned filters are connected to Pins 9 and 10 in order to improve the interference characteristics of the IF amplifier.
- The signal amplified by the IF amplifier is output from Pin 25. The output impedance is approximately  $75 \Omega$ .

**Description of PLL Block**

The PLL on this IC supports the I<sup>2</sup>C bus control format. The control pins are as shown in the table below.

Symbol	Description
ADSW	Address selection
SCL	SCL input
SDA	SDA I/O

**1) Mode Setting Method**

The modes for each frequency step are set according to the MS pin voltage.

Mode	MS pin voltage	Main divider	Reference divider	Reference frequency	Frequency step*
B-0	0 to 0.15 Vcc	15 bit	1024	3.90625 kHz	31.25 kHz
B-1	OPEN	14 bit	512	7.8125 kHz	62.5 kHz
B-2	0.45 Vcc to 0.55 Vcc	15 bit	640	6.25 kHz	50 kHz
B-3	0.65 Vcc to 0.75 Vcc	15 bit	512	7.8125 kHz	62.5 kHz
B-4	0.85 Vcc to Vcc	15 bit	512/ 640/ 1024	7.8125 kHz/ 6.25 kHz/ 3.90625 kHz	62.5 kHz/ 50 kHz/ 31.25 kHz

\* Frequency step is for when X'tal OSC = 4 MHz.

**2) Address Setting**

The responding address can be changed according to the ADSW pin voltage, so that multiple PLL can exist within one system.

## Address

ADSW pin voltage	MA1	MA0
0 to 0.1 Vcc	0	0
OPEN or 0.2 Vcc to 0.3 Vcc	0	1
0.4 Vcc to 0.6 Vcc	1	0
0.9 Vcc to Vcc	1	1

### 3) Programming

The VCO lock frequency is obtained according to the following formula.

$$f_{osc} = f_{ref} \times 8 \times (32M + S)$$

fosc : local oscillator frequency

fref : reference frequency

8 : prescaler fixed frequency division ratio

M : main divider frequency division ratio

S : swallow counter frequency division ratio

The variable frequency division ranges of M and S are as follows, and are set as binary.

$32 \leq M \leq 1023$  ( $32 \leq M \leq 511$  for B-1 mode)

$0 \leq S \leq 31$

3-1) The CXA3235N control format is as follows.
