

NVRAM CONTROLLER for up to EIGHT LPSRAM

- CONVERT LOW POWER SRAMs into NVRAMs
- PRECISION POWER MONITORING and POWER SWITCHING CIRCUITRY
- AUTOMATIC WRITE-PROTECTION when V_{CC} is OUT-OF-TOLERANCE
- TWO INPUT DECODER ALLOWS CONTROL for up to 8 SRAMs (with 2 devices active in parallel)
- CHOICE of SUPPLY VOLTAGES and POWER-FAIL DESELECT VOLTAGES:
 - M40Z300:
 - $V_{CC} = 4.5V$ to $5.5V$
 - $THS = V_{SS} 4.5V \leq V_{PFD} \leq 4.75V$
 - $THS = V_{OUT} 4.2V \leq V_{PFD} \leq 4.5V$
 - M40Z300W:
 - $V_{CC} = 3.0V$ to $3.6V$
 - $THS = V_{SS} 2.8V \leq V_{PFD} \leq 3.0V$
 - $V_{CC} = 2.7V$ to $3.3V$
 - $THS = V_{OUT} 2.5 \leq V_{PFD} \leq 2.7V$
- RESET OUTPUT (\overline{RST}) for POWER ON RESET
- LESS THAN 12ns CHIP ENABLE ACCESS PROPAGATION DELAY (for 5.0V device)
- PACKAGING INCLUDES a 28-LEAD SOIC and SNAPHAT® TOP, or a 16-LEAD SOIC (to be Ordered Separately)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION for a SNAPHAT TOP which CONTAINS the BATTERY
- BATTERY LOW PIN (\overline{BL})

DESCRIPTION

The M40Z300/W NVRAM Controller is a self-contained device which converts a standard low-power SRAM into a non-volatile memory. A precision voltage reference and comparator monitors the V_{CC} input for an out-of-tolerance condition.

Figure 1. Logic Diagram

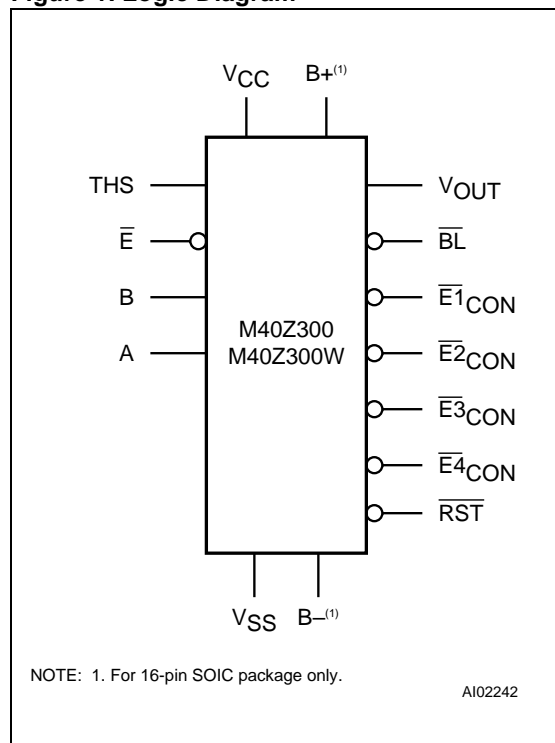

Figure 2A. SOIC28 Connections

Figure 2B. SOIC16 Connections

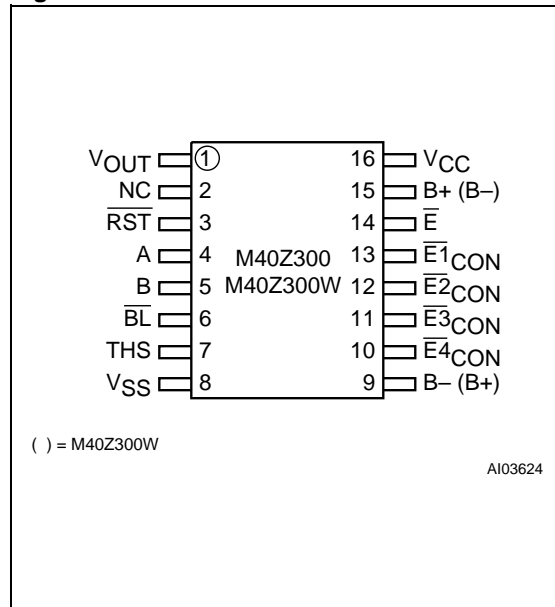

Table 1. Signal Names

THS	Threshold Select Input
\bar{E}	Chip Enable Input
$\bar{E}1_{CON}$ - $\bar{E}4_{CON}$	Conditioned Chip Enable Output
A, B	Decoder Inputs
\bar{RST}	Reset Output (Open Drain)
\bar{BL}	Battery Low Output (Open Drain)
VOUT	Supply Voltage Output
VCC	Supply Voltage
VSS	Ground
B+	Positive Battery Pin
B-	Negative Battery Pin
NC	Not Connected Internally

When an invalid V_{CC} condition occurs, the conditioned chip enable outputs ($\bar{E}1_{CON}$ to $\bar{E}4_{CON}$) are forced inactive to write-protect the stored data in the SRAM. During a power failure, the SRAM is switched from the V_{CC} pin to the lithium cell within the SNAPHAT to provide the energy required for data retention. On a subsequent power-up, the SRAM remains write protected until a valid power condition returns.

The 28 pin, 330 mil SOIC provides sockets with gold plated contacts for direct connection to a separate SNAPHAT housing containing the battery. The SNAPHAT housing has gold plated pins which mate with the sockets, ensuring reliable connection. The housing is keyed to prevent improper insertion. This unique design allows the SNAPHAT battery package to be mounted on top of the SOIC package after the completion of the surface mount process which greatly reduces the board manufacturing process complexity of either directly soldering or inserting a battery into a soldered holder. Providing non-volatility becomes a "SNAP".

The 16 pin SOIC provides battery pins for an external user supplied battery.

Table 2. Absolute Maximum Ratings ⁽¹⁾

Symbol	Parameter	Value	Unit
T _A	Ambient Operating Temperature	0 to 70	°C
T _{STG}	Storage Temperature (V _{CC} Off)	SNAPHAT SOIC -40 to 85 -55 to 125	°C
V _{IO}	Input or Output Voltages	-0.3 to V _{CC} +0.3	V
V _{CC}	Supply Voltage	M40Z300 M40Z300W -0.3 to 7 -0.3 to 4.6	V
I _O	Output Current	20	mA
P _D	Power Dissipation	1	W

Note: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to the absolute maximum rating conditions for extended periods of time may affect reliability.

CAUTION: Negative undershoots below -0.3V are not allowed on any pin while in the Battery Back-up mode.

CAUTION: Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

OPERATION

The M40Z300/W, as shown in Figure 4, can control up to four (eight, if placed in parallel) standard low-power SRAMs. These SRAMs must be configured to have the chip enable input disable all other input signals. Most slow, low-power SRAMs are configured like this, however many fast SRAMs are not. During normal operating conditions, the conditioned chip enable ($\overline{E1CON}$ to $\overline{E4CON}$) output pins follow the chip enable (\overline{E}) input pin with timing shown in Table 7. An internal switch connects V_{CC} to V_{OUT}.

This switch has a voltage drop of less than 0.3V (I_{OUT1}).

When V_{CC} degrades during a power failure, $\overline{E1CON}$ to $\overline{E4CON}$ are forced inactive independent of \overline{E} . In this situation, the SRAM is unconditionally write protected as V_{CC} falls below an out-of-tolerance threshold (V_{PFD}). For the M40Z300 the power fail detection value associated with V_{PFD} is selected by the Threshold Select (THS) pin and is shown in Table 6A. For the M40Z300W, the THS pin selects both the supply voltage and V_{PFD} as shown in Table 6B.

Note: In either case, THS pin must be connected to either V_{SS} or V_{OUT}.

If chip enable access is in progress during a power fail detection, that memory cycle continues to completion before the memory is write protected. If the memory cycle is not terminated within time t_{WPT}, $\overline{E1CON}$ to $\overline{E4CON}$ are unconditionally driven high, write protecting the SRAM. A power failure during a write cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the SRAM's contents. At voltages below V_{PFD} (min), the user can be assured the memory will be write protected within the Write Protect Time (t_{WPT}) provided the V_{CC} fall time exceeds t_F (See Table 7).

As V_{CC} continues to degrade, the internal switch disconnects V_{CC} and connects the internal battery to V_{OUT}. This occurs at the switchover voltage (V_{SO}). Below the V_{SO}, the battery provides a voltage V_{OHV} to the SRAM and can supply current I_{OUT2} (see Table 6A/6B).

When V_{CC} rises above V_{SO}, V_{OUT} is switched back to the supply voltage. Outputs $\overline{E1CON}$ to $\overline{E4CON}$ are held inactive for t_{CER} (120ms maximum) after the power supply has reached V_{PFD}, independent of the \overline{E} input, to allow for processor stabilization (see Figure 6).

DATA RETENTION LIFETIME CALCULATION

Most low power SRAMs on the market today can be used with the M40Z300/W NVRAM Controller. There are, however some criteria which should be used in making the final choice of which SRAM to use. The SRAM must be designed in a way where the chip enable input disables all other inputs to the SRAM. This allows inputs to the M40Z300/W and SRAMs to be Don't Care once V_{CC} falls below V_{PFD} (min). The SRAM should also guarantee data retention down to $V_{CC} = 2.0\text{V}$. The chip enable access time must be sufficient to meet the system needs with the chip enable propagation delays included. If the SRAM includes a second Chip Enable pin (E2), this pin should be tied to V_{OUT} .

If data retention lifetime is a critical parameter for the system, it is important to review the data retention current specifications for the particular SRAMs being evaluated. Most SRAMs specify a data retention current at 3.0V. Manufacturers generally specify a typical condition for room temperature along with a worst case condition (generally at elevated temperatures). The system level requirements will determine the choice of which value to use. The data retention current value of the SRAMs can then be added to the I_{CCDR} value of

Figure 3. AC Testing Load Circuit

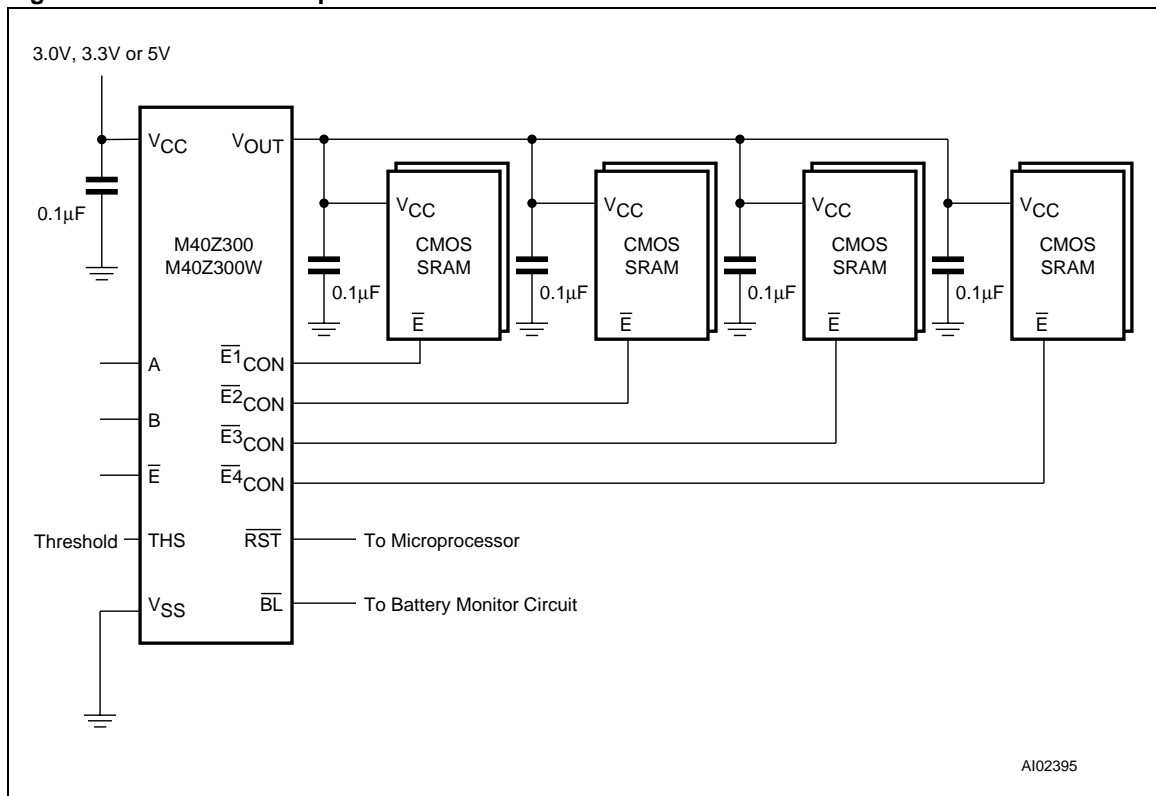

the M40Z300/W to determine the total current requirements for data retention. The available battery capacity for the SNAPHAT of your choice can then be divided by this current to determine the amount of data retention available (see Table 8).

CAUTION: Take care to avoid inadvertent discharge through V_{OUT} and $\overline{E1CON}$ - $\overline{E4CON}$ after battery has been attached.

For a further more detailed review of lifetime calculations, please see Application Note AN1012.

Figure 4. Hardware Hookup

POWER-ON RESET OUTPUT

All microprocessors have a reset input which forces them to a known state when starting. The M40Z300/W has a reset output (\overline{RST}) pin which is guaranteed to be low within t_{WPT} of V_{PFD} (See Table 7). This signal is an open drain configuration. An appropriate pull-up resistor should be chosen to control the rise time. This signal will be valid for all voltage conditions, even when V_{CC} equals V_{SS} .

Once V_{CC} exceeds the power failure detect voltage V_{PFD} , an internal timer keeps \overline{RST} low for t_{REC} to allow the power supply to stabilize.

TWO TO FOUR DECODE

The M40Z300/W includes a 2 input (A, B) decoder which allows the control of up to 4 independent SRAMs. The Truth Table for these inputs is shown in Table 3.

M40Z300, M40Z300W

Table 5. Capacitance ⁽¹⁾
($T_A = 25\text{ }^\circ\text{C}$, $f = 1\text{ MHz}$)

Symbol	Parameter	Test Condition	Min	Max	Unit

		$V_{OUT} > V_{CC} - 0.2$			100	mA
I_{OUT2}	V_{OUT} Current (Battery Back-up)	$V_{OUT} > V_{BAT} - 0.3$		100		μA
I_{CCDR}	Data Retention Mode Current ⁽⁴⁾				100	nA
THS	Threshold Select Voltage		V_{SS}		V_{OUT}	V
V_{PFD}	Power-fail Deselect Voltage (THS = V_{SS})		2.8	2.9	3.0	V
	Power-fail Deselect Voltage (THS = V_{OUT})		2.5	2.6	2.7	V
V_{SO}	Battery Back-up Switchover Voltage			2.5		V

- Note: 1. Outputs deselected.
 2. For RST & BL pins (Open Drain).
 3. Chip Enable outputs ($\overline{E1CON}$ - $\overline{E4CON}$) can only sustain CMOS leakage currents in the battery back-up mode. Higher leakage currents will reduce battery life.
 4. Measured with V_{OUT} and $\overline{E1CON}$ - $\overline{E4CON}$ open.

Table 7. Power Down/Up AC Characteristics
 (T_A = 0 to 70°C)

Symbol	Parameter	Min	Max	Unit	
t _F ⁽¹⁾	V _{PFD} (max) to V _{PFD} (min) V _{CC} Fall Time	300		µs	
t _{FB} ⁽²⁾	V _{PFD} (min) to V _{SS} V _{CC} Fall Time	150		µs	
t _R	V _{PFD} (min) to V _{PFD} (max) V _{CC} Rise Time	10		µs	
t _{EDL}	Chip Enable Propagation Delay Low	M40Z300	12	ns	
		M40Z300W	20	ns	
t _{EDH}	Chip Enable Propagation Delay High	M40Z300	10	ns	
		M40Z300W	20	ns	
t _{AS}	A, B set up to \bar{E}	0		ns	
t _{CER}	Chip Enable Recovery	40	120	ms	
t _{REC}	V _{PFD} (max) to \bar{RST} High	40	120	ms	
t _{WPT}	Write Protect Time	M40Z300	40	150	µs
		M40Z300W	40	250	µs
t _{RB}	V _{SS} to V _{PFD} (min) V _{CC} Rise Time	1		µs	

Note: 1. V_{PFD} (max) to V_{PFD} (min) fall time of less than t_F may result in deselection/write protection not occurring until 200 µs after V_{CC} passes V_{PFD} (min)..
 2. V_{PFD} (min) to V_{SS} fall time of less than t_{FB} may cause corruption of RAM data.

BATTERY LOW PIN

The M40Z300/W automatically performs battery voltage monitoring upon power-up, and at factory-programmed time intervals of at least 24 hours. The Battery Low (\bar{BL}) pin will be asserted if the battery voltage is found to be less than approximately 2.5V. The \bar{BL} pin will remain asserted until completion of battery replacement and subsequent battery low monitoring tests, either during the next power-up sequence or the next scheduled 24-hour interval.

If a battery low is generated during a power-up sequence, this indicates that the battery is below 2.5V and may not be able to maintain data integrity in the SRAM. Data should be considered suspect, and verified as correct. A fresh battery should be installed.

If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal V_{CC} is supplied. In order to insure data integrity during subsequent periods of battery back-up mode, the battery should be replaced. SNAPHAT top should be replaced with valid V_{CC} applied to the device.

The M40Z300/W only monitors the battery when a nominal V_{CC} is applied to the device. Thus applications which require extensive durations in the battery back-up mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique. The \bar{BL} pin is an open drain output and an appropriate pull-up resistor to V_{CC} should be chosen to control the rise time.

Figure 5. Power Down Timing

Figure 6. Power Up Timing

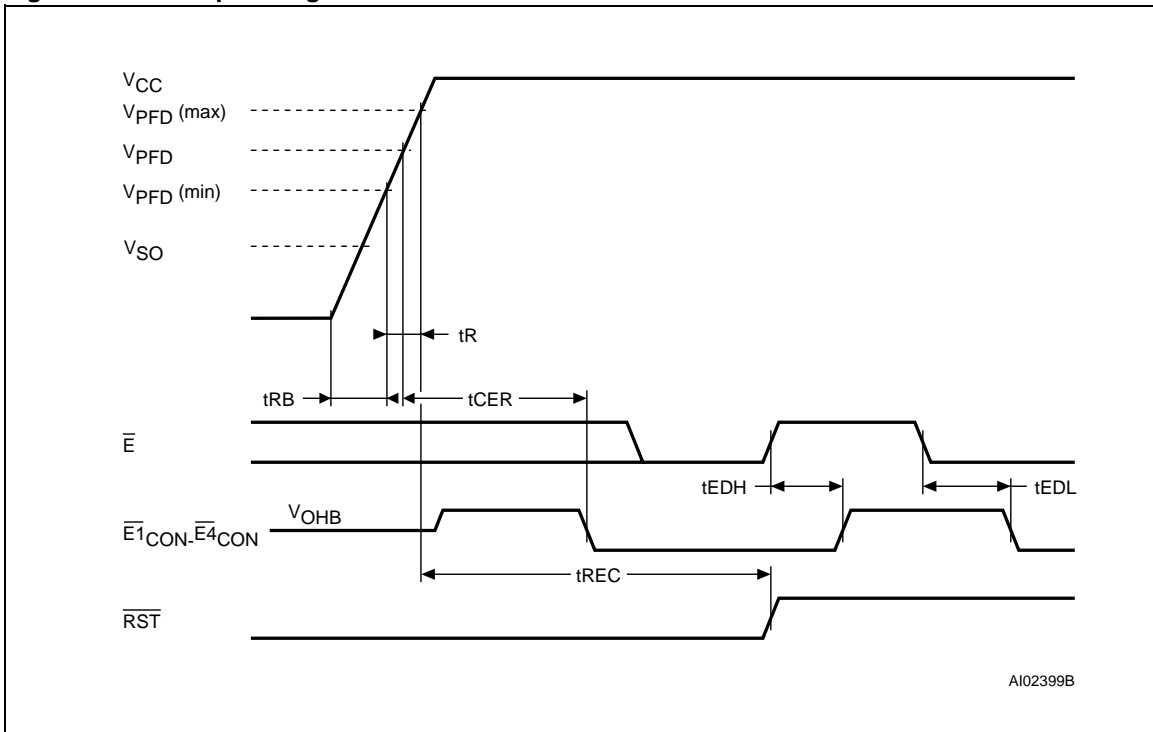

Figure 7. Address-Decode Time

Note: During system design, compliance with the SRAM timing parameters must comprehend the propagation delay between \bar{E} and \bar{E}^1_{CON}

Table 8. Battery Table

V_{CC} NOISE AND NEGATIVE GOING TRANSIENTS

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy, which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur.

A ceramic bypass capacitor value of 0.1μF (as shown in figure 8) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, STMicroelectronics recommends connecting a schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC}, anode to V_{SS}). Schottky diode 1N5817 is recommended for through hole and MBR5120T3 is recommended for surface mount.

Figure 8. Supply Voltage Protection

<p>Example:</p> <p>Supply Voltage and Write Protect Voltage</p> <p>300 = $V_{CC} = 4.5V$ to $5.5V$ THS = V_{SS} $4.5V \leq V_{PFD} \leq 4.75V$ THS = V_{OUT} $4.2V \leq V_{PFD} \leq 4.5V$</p> <p>300W = $V_{CC} = 3.0V$ to $3.6V$ THS = V_{SS} $2.8V \leq V_{PFD} \leq 3.0V$ $V_{CC} = 2.7V$ to $3.3V$ THS = V_{OUT} $2.5V \leq V_{PFD} \leq 2.7V$</p> <p>Package</p> <p>MH^(1,2) = SOH28 MQ = SO16</p> <p>Temperature Range</p> <p>1 = 0 to 70 °C</p> <p>Shipping Method for SOIC</p> <p>blank = Tubes TR = Tape & Reel</p>	<p>M40Z300W</p>	<p>MH</p>	<p>1</p>	<p>TR</p>
--	-----------------	-----------	----------	-----------

Note: 1. The SOIC package (SOH28) requires the battery package (SNAPHAT) which is ordered separately under the part number "M4Zxx-BR00SH1" in plastic tube or "M4Zxx-BR00SH1TR" in Tape & Reel form.
 2. Delivery may include either the 2-pin version of the SOIC/SNAPHAT or the 4-pin version of the SOIC/SNAPHAT. Both are functionally equivalent (see package drawing section for details).

Caution: Do not place the SNAPHAT battery package "M4Zxx-BR00SH1" in conductive foam since will drain the lithium button-cell battery.

For a list of available options (Speed, Package, etc..) or for further information on any aspect of this device, please contact the ST Sales Office nearest to you.
