

DESCRIPTION

The LX7001 is an improved undervoltage sensing circuit specifically designed for use as a reset controller in microprocessor-based systems. Today's complex miniaturized systems present difficult challenges to the system designer such as overcoming spurious noise problems. The LX7001 is optimized for systems that must be tolerant of high-speed power supply glitches caused by high-speed logic transitions and similar switching phenomena. The LX7001 offers a unique stage that couples glitch immunity with a micropower, ultra-stable band-gap reference for precision sensing of undervoltage conditions. It offers the designer an

economical, space-efficient solution for low supply voltage detection when used in combination with a single pull-up resistor. Adding one capacitor offers the functionality of a programmable delay time after power returns. Additionally, the LX7001 offers excellent temperature stability. A high-quality trimmed voltage reference and bias circuit permit very accurate and repeatable undervoltage sensing. The remaining blocks consist of a comparator with hysteresis, high current clamping diode and open collector output stage capable of sinking up to 60mA. The LX7001's $\overline{\text{RESET}}$ output is specified to be fully functional at $V_{\text{IN}}=1\text{V}$.

KEY FEATURES

- Fully Characterized, Transient Immune Input Stage (See Product Highlight)
- Monitors 5V Supplies ($V_{\text{TRIP}}=4.6\text{V Typ.}$)
- Outputs Fully Defined At $V_{\text{CC}}=1\text{V}$
- Ultra-Low Supply Current (500 μA Max. Over Temp)
- Temperature Compensated I_{CC} For Extremely Stable Current Consumption
- μP Reset Function Programmable With 1 External Resistor And Capacitor
- Comparator Hysteresis Prevents Output Oscillation
- Electrically Compatible With Motorola MC34064
- Pin-to-Pin Compatible With Motorola MC34064/MC34164

ELECTRICAL CHARACTERISTICS

(Unless otherwise specified, these specifications apply over the operating ambient temperatures of $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ for the LX7001C, $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ for the LX7001I, and $-55^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ for the LX7001M. Low duty cycle pulse testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)

TYPICAL APPLICATION CIRCUITS

FIGURE 13. — LOW VOLTAGE MICROPROCESSOR RESET.

A time delayed reset can be accomplished with the addition of C_{DLY} . For systems with extremely fast power supply rise times ($< 500\text{ns}$) it is recommended that the RC_{DLY} time constant be greater than $5.0\mu\text{s}$. $V_{TH(MPU)}$ is the microprocessor reset input threshold.

$$t_{DLY} = R C_{DLY} \ln \left[\frac{1}{1 - \frac{V_{TH(MPU)}}{V_{IN}}} \right]$$

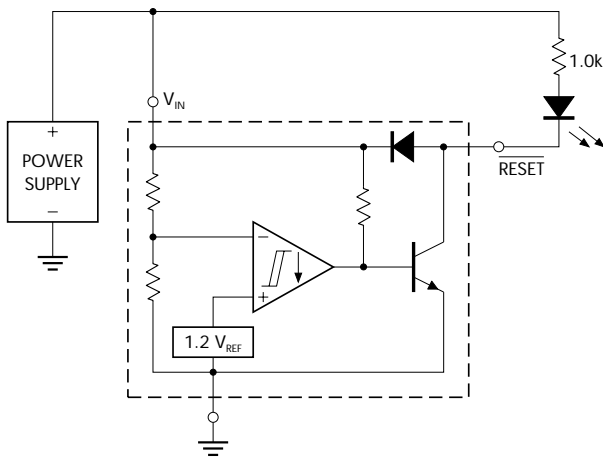

FIGURE 16. — MOSFET LOW VOLTAGE GATE DRIVE PROTECTION.

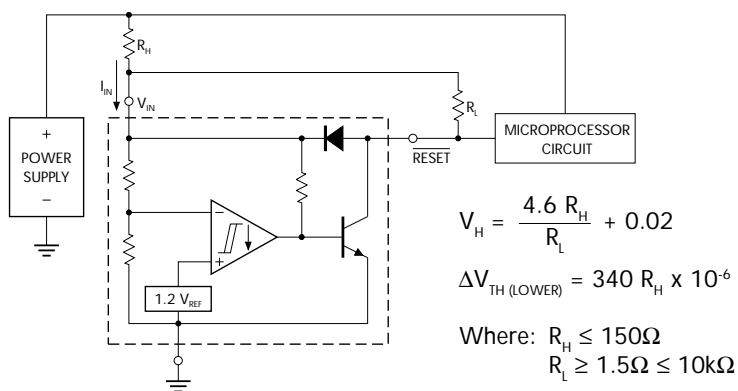

Overheating of the logic level power MOSFET due to insufficient gate voltage can be prevented with the above circuit. When the input signal is below the 4.3 volt threshold of the LX7001C, its output grounds the gate of the L^2 MOSFET.

Comparator hysteresis can be increased with the addition of resistor R_H . The hysteresis equation has been simplified and does not account for the change of input current I_{IN} as V_{CC} crosses the comparator threshold. An increase of the lower threshold $\Delta V_{TH(LOWER)}$ will be observed due to I_{IN} which is typically $340\mu A$ at $4.59V$. The equations are accurate to $\pm 10\%$ with R_H less than 150Ω and R_L between $1.5k\Omega$ and $10k\Omega$.
