

## Features

- 667 Mb/s port data bandwidth, >50Gb/s aggregate bandwidth
- Low power CMOS, 2.5V and 3.3V power supply
- SRAM-based, in-system programmable
- 160 configurable I/O ports
  - 80 dedicated differential input ports
  - 80 dedicated differential output ports
  - Supports LVDS and LVPECL I/O
  - LVTTTL control interface
  - Output Enable control for all outputs
- Non-blocking switch matrix
  - Patented ActiveArray™ matrix for superior performance
  - Double-buffered configuration RAM cells for simultaneous global updates
  - ImpliedDisconnect™ function for single cycle disconnect/connect
- Full Broadcast and multicast capability
  - One-to-One and One-to-Many connections
  - Special broadcast mode routes one input to all outputs at maximum data rate
- Registered and flow-through data modes
  - 333 MHz synchronous mode
  - 667 Mb/s asynchronous mode
  - Low jitter and signal skew
  - Low duty cycle distortion
- RapidConfigure™ parallel interface for configuration and readback
- JTAG serial interface for configuration and Boundary Scan testing
- 420 BGA package with 1.27mm ball spacing

## Description

The OCX™ family of SRAM-based devices are non-blocking  $n \times n$  digital crosspoint switches capable of data rates of 667 Megabits per second per port. The I/O ports are fixed as either input or output ports. The input ports support flow-through mode only. The output ports are individually programmable to operate in either flow-through (asynchronous) or registered (synchronous) mode. Each output register may be clocked by a global clock or a next neighbor clock source.

The patented ActiveArray provides greater density, superior performance, and greater flexibility compared to a traditional  $n:1$  multiplexer architecture. The OCX devices support various operating modes covering one input to one output at a time as well as one input to many outputs, plus a special broadcast mode to program one input to all outputs while maintaining maximum data rates. In all modes data integrity and connections are maintained on all unchanged data paths.

The RapidConfigure parallel interface allows fast configuration of both the Output Buffers and the switch matrix. Readback is supported for device test and verification purposes. The OCX160 also supports the industry standard JTAG (IEEE 1149.1) interface for boundary scan testing. The JTAG interface can also be used to download configuration data to the device and readback data. A functional block diagram of the OCX160 is shown in Figure 1.

## Applications

- SONET/SDH and DWDM
- System Backplanes and Interconnects
- ATM Switch Cores
- Digital Cross-Connects
- High Speed Test Equipment
- Video Switching

## 1. Introduction

The OCX160 is a differential crosspoint-switching device. The main functional block of the device is a Switch Matrix as shown in Figure 1. The Switch Matrix is a  $x$ - $y$  structure supporting an input-to-output data flow. Figure 2 shows a conceptual view of the switch matrix with inputs connected to the horizontal trace and outputs to the vertical trace. Connections between vertical and horizontal lines are implemented with a proprietary high-performance buffering circuit. Signal path delays through the Switch Matrix are very well balanced, resulting in predictable and uniform pin-to-pin delays.

**Note** – For the purpose of clarity, the logic diagrams within this data sheet are conceptual representations only and do not show actual circuit implementation.

**Figure 2** OCX160 Switch Matrix

The Active SRAM cells are responsible for establishing connections in the switch matrix by turning on the interconnect circuit, while the Loading SRAM cell can be used to store a second configuration that can be transferred to the Active SRAM cell at a later time. The two SRAM cells are arranged so that a double buffered scheme can be employed. Through the use of an internal signal (generated automatically during a programming cycle) it is possible to store a second configuration map in the Loading SRAM while the Active SRAM maintains its present connection status. When the UPDATE# signal is asserted low, the contents of the Loading SRAM cell are transferred to the Active SRAM cell and the switch matrix connection is either made or broken.

The UPDATE# signal can be used to control when the switch matrix is reconfigured. For instance, as long as the UPDATE# signal is asserted high, the Loading SRAM cells for the entire switch matrix could be changed without affecting the current configuration of the switch. When the UPDATE# signal is asserted low, the entire switch matrix would be reconfigured simultaneously. If the UPDATE# signal is asserted continuously, all crosspoint programming commands (generated by RapidConfigure or JTAG programming cycles) will take effect immediately, since the Loading SRAM cell's contents will be transferred directly to the Active SRAM cell.

## 1.1 Input and Output Buffers

All of the input buffers are differential inputs with flow-through mode. The output buffers are programmable for either flow-through or registered mode. Figure 3 shows the basic block diagram of the input and output blocks with the sources for the output control signals (OE# and CLK). The control signals are explained in more details in the following sections.

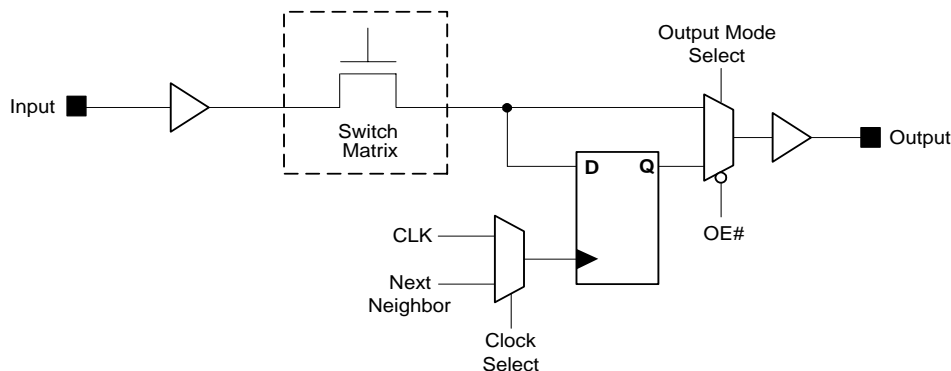

Figure 3 Input and Output Buffer Configuration

### 1.1.1 Input and Output Port Function Mode

The following legend describes the various modes of the Input and Output Ports and the specification used by the OCXPro™ Software.

Legend:

**A<sub>x</sub>**—Switch Matrix Signal

**P<sub>x</sub>**—Port Signal

**OE#**—Output Enable (# means “Active Low”)

**CLK**—Clock

Table 1 Summary for Programmable I/O Attributes for OCX160

Symbol	I/O Port Function	Mnemonic
	<b>Input</b> – The external signal is buffered from the Input Port pin to the corresponding Switch Matrix line.	<b>IN</b>
	<b>Output</b> – The internal signal is buffered from the corresponding Switch Matrix line to the Output Port pin. In this mode an optional output enable (OE#) can be selected. The default state is logic high with enable set to ON.	<b>OP</b>
	<b>Registered Output</b> – The internal signal on the Switch Matrix line is registered by an edge-triggered register within the Output Port. A clock source is required in this mode. An output enable (OE#) is available but not required.	<b>RO</b>
	<b>No Connect</b> – In this mode, the output Port pin is isolated from the Switch Matrix.	<b>NC</b>

## 1.1.2 Broadcast Mode

The OCX160 has a special Broadcast Mode which connects any input to all outputs without performance degradation. The input is selected using RapidConfigure or JTAG and disconnects all other inputs. The Global Update pin (UPDATE#) must be held high during Broadcast Mode. Asserting the UPDATE# pin returns the array to the previous program condition.

## 1.2 Output Buffer Configuration

Every output port of the OCX160 can be configured as either a flow-through or registered output. In registered mode there are two clock sources that are available:

- Global Clock
- Next Neighbor

Additionally, there are output control signals.

### 1.2.1 Output Control Signals

Every output port of the OCX has a global Output Enable signal (OE#). All output buffers have output enables that have programmable polarity and are individually configurable.

Additionally each output can be permanently enabled (always ON) or disabled (always OFF) which is useful for applications which need to tri-state outputs (for example when using multiple chips in expansion mode) or for power saving in designs that do not need to use all the outputs available.

Two control bits are used to control the function of the output enable function as described in Table 5.

### 1.2.2 Neighboring Output Port as a Clock Source

A physically adjacent port can be used as a clock source for an output port configured in registered mode. These outputs are grouped in pairs such that the signal being switched through OUT0 can be used to clock the signal being switched through OUT1, and vice versa. Any single clock or data input signal can be used to clock any other input signal provided they are switched to an appropriate output pair (see Table 2). Figure 4 shows the implementation of next neighbor output port clocking in the OCX160 switch.

For example, IN<sub>x</sub> is used for data input while IN<sub>y</sub> is used for the corresponding clock. IN<sub>x</sub> is connected to OUT0 via the crosspoint array while IN<sub>y</sub> is connected to OUT1 via the crosspoint array. OUT0 is configured in registered output (RO) mode with OUT1 as its next neighbor clock selection. OUT1 will output the clock signal as well as clock the data in OUT0. Adjacent port selection is required for next neighbor clocking in the registered output mode.

This feature is useful in many applications where different types of data switching through the crosspoint array have various associated clocks. To match the delays in the data and corresponding clocks, it is common practice to pass the clocks through the switch along with the data.

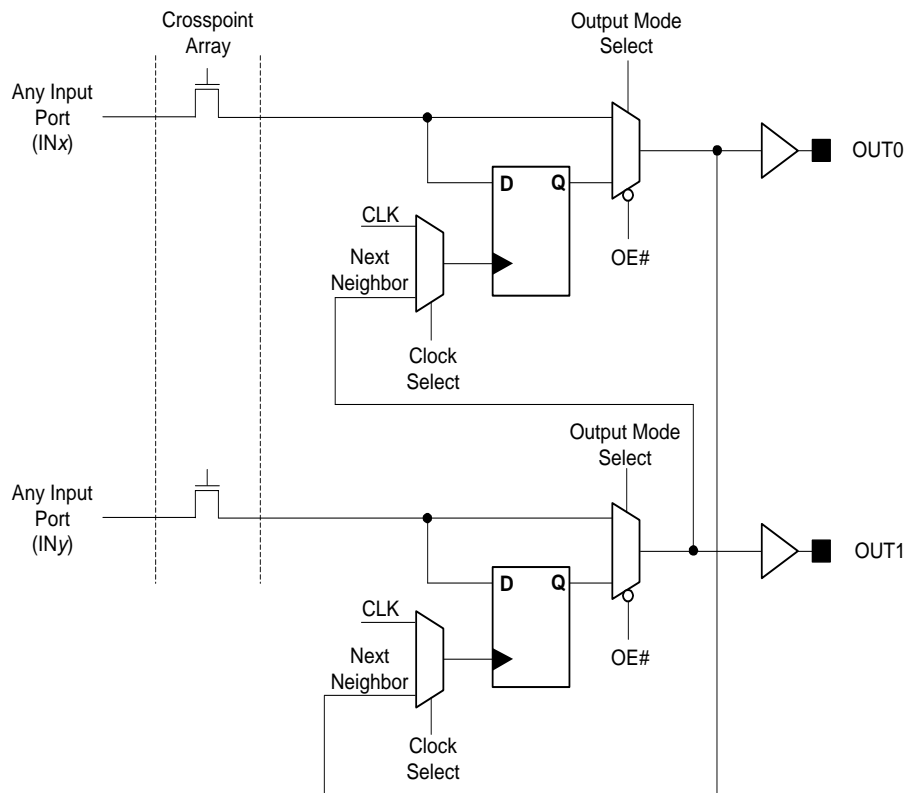

Figure 4 Next Neighbor Clock Block Diagram

The advantages of next neighbor clocking are:

1. Using next neighbor clocking in the registered output (RO) mode helps reduce the skew in outgoing data.
2. For a design with a large number of outputs switching simultaneously, next neighbor clocking mode is useful to stagger outputs for reduced board noise caused by simultaneous switching outputs.

**Note** – Selecting the next neighbor clock for both outputs at the same time is not recommended. Only one output in the pair at a time can be clocked by its next neighbor.

Table 2 Next Neighbor Outputs

Pairing Sequence for Neighboring Outputs								
Output Next Neighbor Pairs	0,1	2,3	4,5	6,7	8,9	▶▶▶▶	76,77	78,79

Only OUT1 can neighbor with OUT0, OUT3 with OUT2, etc. OUT2 cannot neighbor with OUT1, or OUT4 with OUT3, etc.

## 1.3 RapidConfigure Interface

RapidConfigure (RC) is a 25 signal parallel interface that is used to program the OCX160 device. The 25 pins are allocated as follows:

RCA[6:0] = RapidConfigure Address A. RCA are input pins.

RCB[6:0] = RapidConfigure Address B. RCB are input pins.

RCI[3:0] = RapidConfigure Instruction Bits

RCO[4:0] = RapidConfigure Readback. RCO are output pins.

RC\_CLK# = RapidConfigure Clock (negative edge clock)

RC\_EN# = RapidConfigure Cycle Enable (active low)

### 1.3.1 RapidConfigure Programming Instructions

The RC interface supports both write and read types of operations:

1. Write Operations (reset crosspoint and Input or Output Buffer (IOB), configure an Output Buffer, connect/disconnect crosspoint)
2. Read Operations (Output Buffer and crosspoint configuration read).

**Table 3 RapidConfigure Programming Instructions**

RCI[3:0]	RCA[6:0]	RCB[6:0]	RCO[4:0]	Instruction	Description
0000				Reserved	
0001				Reserved	
0010	X	X		Reset Crosspoint Array	Reset the entire crosspoint array to no connect. All Output Buffers remain unchanged by this operation.
0011	X	Input Port Address		Set Array to Broadcast mode	Connects the input selected by RCB[6:0] to all output ports and disconnects all other inputs. The Global Update (UPDATE#) pin must be held high during Broadcast mode. Activating the Global Update pin returns the array to the previous program condition.
0100	Output Port Address	Data		Configure an Output Buffer	Program an Output Buffer specified by RCA[6:0]. See Table 5 for RCB[6:0] bit assignment and buffer functionality.
0101				Readback Crosspoint, Output Buffer status	This is a two-cycle instruction.
<u>Cycle 1</u>	Output Port Address	Input Port Address	X		Specify the crosspoint connect status at input location specified by RCA[6:0] to the output location specified by RCB[6:0].

**Table 3 RapidConfigure Programming Instructions (Continued)**

RCI[3:0]	RCA[6:0]	RCB[6:0]	RCO[4:0]	Instruction	Description
<u>Cycle 2</u>	X	X	Output Data		Readback (using RCO[4:0]) the status of the input buffer specified in Cycle 1 by RCA[6:0], the output buffer specified in Cycle 1 by RCO[4:0] and the crosspoint connect status.  See Table 4 for RCO[4:0] readback pin assignment.
0110	X	X		Update	Program the Global Update function without the use of the UPDATE# pin.
0111	X	Input Port Address		Disconnect Input	Disconnect the crosspoint cells of the input row location specified by RCA[6:0].
1000	Output Port Address	Input Port Address		Disconnect Input and Output	Disconnect the crosspoint cell at the input location specified by RCA[6:0] to the output location specified by RCB[6:0].  All other connections from the source input address or to the same output address remain the same as before.
1001	Output Port Address	Input Port Address		Connect, with ImpliedDisconnect	Connect the crosspoint cell at the input location specified by RCA[6:0] to the output location specified by RCB[6:0].  All other connections from the same input address or to the same output address are set to no connect (NC).
1010	Output Port Address	Input Port Address		Connect, without ImpliedDisconnect	Connect the crosspoint cell at the input location specified by RCA[6:0] to the output location specified by RCB[6:0].  All other connections from the same input address remain the same as before.
1011				Reserved	
1100				Reserved	
1101	X	X		Reset All	Reset the switch matrix to no connects (NC). Output Buffers default to flow-through mode (OP) with output enable set to always enabled (ON). Output Buffer defaults to select Global Clock (CLK) source even though mode is OP.
1110				Reserved	
1111				Reserved	

**Note** – X = Don't care.

**Table 4 RCO[4:0] Readback Pin Assignment**

RCO[4:0]	Readback Location	Signal/Function
O4	Crosspoint	<b>Connection Status:</b> 0 = No connection (NC) — (default state at reset) 1 = Connected
O3	Output Buffer	<b>Clock Select:</b> 0 = Global Clock — (default state at reset) 1 = Next Neighbor
O2	Output Buffer	<b>Output Mode:</b> 0 = Flow-through (OP) — (default state at reset) 1 = Registered (RO)
O1, O0 0,0 0,1 1,0 1,1	Output Buffer	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

**Table 5 Programming an Output Buffer using RapidConfigure**

RCB[6:0]	Signal/Function
B6, B5, B4	Don't care
B3	<b>Clock Select:</b> 0 = Global Clock 1 = Next Neighbor
B2	<b>Output Mode:</b> 0 = Flow-through (OP) 1 = Registered (RO)
B1, B0 0,0 0,1 1,0 1,1	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

### 1.3.2 ImpliedDisconnect

ImpliedDisconnect is a feature that provides the ability to make fast switch connection changes. When using the RC instruction “Connect, with ImpliedDisconnect” to establish a new connection, any existing connection to that output port is automatically broken. Thus, a connection change, i.e. breaking an existing connection and then making a new one, can be accomplished in one RapidConfigure cycle.

## 1.4 JTAG Configuration Controller

The Output port attributes and the Switch Matrix connections can be programmed using the JTAG serial bus. The RapidConfigure Interface can be enabled or disabled using the JTAG serial bus.

The JTAG-based serial mode is always available for configuration regardless of whether the RapidConfigure mode is enabled or disabled. However, proper care must be taken when switching between JTAG and RapidConfigure for configuring the devices. Before attempting to change Switch Matrix connections or output port configuration through JTAG, the user must first ensure that the RapidConfigure mode is disabled by using JTAG serial mode to set the RCE bit to zero in the Mode Control Register.

### 1.4.1 JTAG Interface

The dedicated JTAG TAP interface is designed in compliance with the IEEE-1149.1. The standard interface has five pins: Test Data Out (TDO), Test Mode Select (TMS), Test Data In (TDI), Test Reset (TRST#), and Test Clock (TCK), which allow Boundary Scan Testing as well as device configuration and verification. The I-Cube supplied software will automatically generate the necessary bitstream from a higher-level textual description of the required configuration. Data on the TDI and TMS pins are clocked into the device on the rising edge of the TCK signal, while the valid data appears on the TDO pin after the falling edge of TCK. For more detailed information on JTAG programming, refer to the *OCX160 Register Programming Manual*.

### 1.4.2 Output Port Configuration

Output port configuration is accomplished by loading the appropriate bitstream into the programming registers present at each Output port. The JTAG serial bus is used to load configuration data into the Output port programming registers, one Output port at a time.

### 1.4.3 Switch Matrix Configuration

The contents of the SRAM cells controlling Switch Matrix connection can be modified using the JTAG. This is accomplished by loading the configuration data, one word at a time, into the SRAM cells in the Switch Matrix.

### 1.4.4 Mode Control Register Configuration

The OCX160 contains a single bit Mode Control Register used to store user flags for RapidConfigure Enable (RCE). These are required for proper functioning of the device. The contents of this register can be changed using the JTAG interface and a special JTAG instruction.

**Table 6 Mode Control Register**

RCE	Mode
0	RapidConfigure interface disabled (OFF)
1	RapidConfigure interface enabled (ON)

## 1.4.8 JTAG Instructions

**Table 8 JTAG Instructions**

I [3:0]	BB	BA	B9	B8	B7	A6-A0	Instruction	Description
0 0 0 0	X	X	X	X	X	X	Sample/EXTEST	Places the device in scan mode.
0 0 0 1	X	X	X	X	X	X	Sample/EXTEST	Places the device in scan mode.
0 0 1 0	X	X	X	X	X	X	Reset the Crosspoint Array	Resets the entire Crosspoint Array to no-connect. All other Output Buffer configurations are unchanged by this operation.
0 0 1 1	X	X	X	X	X	X	Set Array for Broadcast mode	Use the JTAG Address Register as the Input address to be the broadcast input Connects the selected Input to all Output cells and disconnects all other Inputs. Activating the Global Update JTAG instruction returns the Crosspoint array from the Broadcast mode to the previous programmed state.
0 1 0 0	X	Clock Select	Data Mode	OE	OE	Output Buffer Address	Program a Buffer	Programs the Output Buffer address specified in the JTAG instruction (A6-A0). The configuration data is also specified in the JTAG instruction bits BA-B7. See Table 9 for bit assignment of the Buffer functionality.
0 1 0 1	X	X	X	X	X	Output Address/Buffer	Configuration readback	<p>Readback the connectivity of the Crosspoint cell with the Input location specified in the JTAG Address Register and the Output location specified JTAG instruction (A0-A6). It also returns the configuration of the Output Buffer addressed in the JTAG instruction (A0-A6).</p> <p>The readback data is shifted out of TDO in the following sequence:</p> <ol style="list-style-type: none"> <li>1. Crosspoint Connect (1=connected, 0=no connection)</li> <li>2. Output Enable—B7 (see Table 9)</li> <li>3. Output Enable—B8 (see Table 9)</li> <li>4. Output Data Source—B9 (0=Flow-through, 1=registered)</li> <li>5. Output Clock Select—BA (0=Global Clock, 1=Next Neighbor)</li> <li>6. State of Broadcast bit</li> <li>7. State of the RCE bit</li> </ol> <p>NOTE: This instruction does not increment the JTAG Address Register. This instruction also requires two DR cycles</p>
0 1 1 0	X	X	X	X	X	X	Update the Crosspoint Array	Update the programmed connection from the Loading SRAM to the Active SRAM.
0 1 1 1	X	X	X	X	X	X	Disconnect Input cell	Disconnect the Crosspoint connections from the Input address specified in the JTAG Address Register.

**Table 8 JTAG Instructions (Continued)**

I [3:0]	BB	BA	B9	B8	B7	A6-A0	Instruction	Description
1 0 0 0	X	X	X	X	X	Output Address	Disconnect Input and Output	Disconnect the Crosspoint cell at the Input location specified at the JTAG Address Register and the Output location specified in the Disconnect JTAG instruction (A6-A0). All other connections from the same input address or to the same output address remain the same.
1 0 0 1	X	X	X	X	X	Output Address	Connect with ImpliedDisconnect	Connects the Crosspoint cell at the Input location specified on the JTAG Address Register and the output location specified in the Connect JTAG instruction (A6-A0). All other connections from the same Input address or the same Output address are set to no-connects. NOTE: This instruction increments the JTAG Address Register (Input address).
1 0 1 0	X	X	X	X	X	Output Address	Connect—no ImpliedDisconnect	Connects the Crosspoint cell at the Input address specified in the JTAG Address Register and the Output address specified in the Connect JTAG instruction (A6-A0). All other connections from the same input remain the same as before.
1 0 1 1	X	X	X	X	X	Input Address	Set the JTAG Address Register	Sets the 7-bit JTAG Address Register with the 7-bit address (A6-A0) of the JTAG Instruction Register. The 7-bit address of the JTAG Address Register becomes the Input port address for Crosspoint Access.
1 1 0 0	X	X	X	X	X	X	Device ID out	Serialize the device ID and revision history out to TDO. ID for the OCX160 is <b>0x0000B89F</b>
1 1 0 1	X	X	X	X	X	X	Reset Output Buffer and Crosspoint Array	Resets the Crosspoint Array to no-connects. Sets the Output buffer to Flow-through mode with Output Enabled. The device ID is serialized to TDO.
1 1 1 0	X	X	X	X	X	X	Set RCE Bit	Sets the RCE bit of the Mode Control Register with the JTAG instruction bit A0. To turn ON the RCE bit, encode bit A0 to 1. To turn OFF the RCE bit, encode bit A0 to 0.
1 1 1 1	X	X	X	X	X	X	Bypass	Places device in a mode to pass TDI data to TDO with one clock delay. Used for programming and testing devices through serial connected JTAG controls.

**Table 9 Programming an Output using JTAG**

BA, B9, B8, B7	Signal/Function
BA	<b>Clock Select:</b> 0 = Global Clock 1 = Next Neighbor
B9	<b>Output Mode:</b> 0 = Flow-through (OP) 1 = Registered (RO)
B8, B7 0,0 0,1 1,0 1,1	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

**Table 10 Number of JTAG Cycles and Configuration Time**

Operation	OCX160
	JTAG Cycles
JTAG Reset Sequence (TMS = “11111”)	7
Enable or Disable RapidConfigure	28
Change attributes of ONE Output Port	28
Change attributes of ALL Output Ports	2,240
Reset JTAG Controller + Reset ALL Output Ports + Clear ALL SRAM cells	35
Connect or disconnect two Ports	56
Configure Entire Switch Matrix	181,440
Completely Configure the Device (All Output Ports and All Switch Matrix Connections)	183,680

### 1.5 Device Reset Options

The power-on reset, RapidConfigure reset, hardware reset, and JTAG reset functions will program the output buffers to flow-through mode (with Global Clock selected), and Output Enabled (ON). JTAG can be reset via the TRST# pin or by clocking five consecutive one to the TMS pin. The hardware reset pin can be done accomplished through the HW\_RST# pin (active low). RC reset can be accomplished by applying the RC instruction 1101 to the RCI[3:0] pins.

**Table 11 Device Reset Options**

Programming Interface	Reset Method	Output Ports	Switch Matrix	RCE Mode Control	JTAG TAP
<b>Hardware Reset</b>	Power-on Reset	OP	NC	1 (RC Enabled)	TLR <sup>1</sup>
	HW_RST# (low pulse)	OP	NC	1 (RC Enabled)	TLR
<b>JTAG Reset</b>	1. Low Pulse on TRST#	Unchanged	Unchanged	Unchanged	TLR
	2. TMS high for 5 TCLK cycles	Unchanged	Unchanged	Unchanged	TLR
	3. Device Reset (instruction 1101)	OP	NC	1 (RC Enabled)	TLR
	4. Reset Crosspoint Array (instruction 0010)	Unchanged	NC	Unchanged	Unchanged
<b>RapidConfigure Reset</b>	1. Device reset (instruction 1101)	OP	NC	1 (RC Enabled)	Unchanged
	2. Reset Crosspoint Array (instruction 0010)	Unchanged	NC	Unchanged	Unchanged

1. TLR = Test Logic Reset state.

## 2. Pin Description

**Table 12 OCX160 Pin Description**

Pin Name	# of Pins	Type	Description
INP[79:0]	80	Input	Non-inverting differential input signals
INN[79:0]	80	Input	Inverting differential input signals
OUTP[79:0]	80	Output	Non-inverting differential input signals
OUTN[79:0]	80	Output	Inverting differential input signals
CLKP	1	Input	Non-inverting differential Global Clock
CLKN	1	Input	Inverting differential Global Clock
OE#	1	Input	Global Output Enable
HW_RST#	1	Input	Hardware Reset
UPDATE#	1	Input	Global Update
<b>RC Pins</b>			
RCA[6:0]	7	Input	RapidConfigure Address A
RCB[6:0]	7	Input	RapidConfigure Address B
RCO[4:0]	5	Output	RapidConfigure Readback
RCI[3:0]	4	Input	RapidConfigure Instruction Bits
RC_CLK#	1	Input	RapidConfigure Clock
RC_EN#	1	Input	RapidConfigure Cycle Enable
<b>JTAG Pins</b>			
TCK	1	Input	JTAG Test Clock
TMS	1	Input	JTAG Test Mode Select
TDI	1	Input	JTAG Test Data In
TRST#	1	Input	JTAG Test Reset
TDO	1	Output	JTAG Test Data Out
<b>Power and Ground Pins</b>			
V <sub>DD</sub> .CORE	12	2.5V Power	Core Voltage
V <sub>DD</sub> .PAD <sup>(2, 3)</sup>	8	2.5V or 3.3V Power	Differential Output Buffer Voltage
V <sub>DD</sub> .IN <sup>(1, 4)</sup>	8	3.3V Power	LVTTL Control pins Voltage and Differential Input Buffer Voltage
V <sub>SS</sub>	36	Ground	Ground

**NOTES:**

1. Dedicated differential input buffers can receive both LVDS and LVPECL voltage levels using 3.3V supply.
2. V<sub>DD</sub>.PAD is 2.5V for LVDS outputs or 3.3V for LVPECL outputs.
3. Dedicated differential output buffers can be biased using different supplies for V<sub>DD</sub>.PAD and external resistors to support both LVDS and LVPECL output voltage levels.
4. The LVTTL control, JTAG pins, and differential input ports are 3.3V—they are not 5V tolerant.
5. The differential output pins powered from 2.5V are 3.3V tolerant.

### 3. Differential I/O Standards

The OCX160 support the two most popular differential signaling standards: Low Voltage Differential Signaling (LVDS) and Low Voltage Positive Emitter Coupled Logic (LVPECL).

LVDS is typically used in communication systems as high speed, low noise point-to-point links. The OCX160 conforms to the ANSI/TIA/EIA-644 standard covering electrical specifications for output drivers and receiver inputs.

LVPECL is commonly used in video switching applications or those designs requiring transmission of high-speed clock signals.

#### 3.1 LVDS

LVDS is a differential signaling standard. It requires that one data bit is carried through two signal lines. As with all differential signaling standards, LVDS has an inherent noise immunity over single-ended standards. The voltage swing between two signal lines is approximately 350mV. The use of a reference voltage or a board termination voltage is not required. LVDS requires the use of two pins per input or output. LVDS requires external resistor termination.

Transmitting and receiving circuits for LVDS are shown in Figures 7 and 8.

Figure 7 Transmitting LVDS Signal Circuit

Figure 8 Receiving LVDS Signal Circuit

## 3.2 LVPECL

LVPECL is another differential signaling standard that specifies two pins per input or output. The voltage swing between these two signal lines is approximately 850 mV. The use of a reference voltage or a board termination voltage is not required. The LVPECL standard requires external resistor termination.

Transmitting and receiving circuits for LVPECL are shown in Figures 9 and 10.

Figure 9 Transmitting LVPECL Signal Circuit

Figure 10 Receiving LVPECL Signal Circuit

### 3.3 Termination Resistor Packs

Resistor packs are available with the values and the configuration required for LVDS and LVPECL termination from Bourns, Inc. The part numbers are listed in Table 13. For pricing and availability questions, please contact them directly at [www.bourns.com](http://www.bourns.com).

**Table 13 Termination Resistor Packs**

Bourns Part Number	Differential I/O Standard	Termination for:	Pairs per Pack	No. of Pins
CAT16-LV2F6	LVDS	Driver	2	8
CAT16-LV4F12	LVDS	Driver	4	16
CAT16-PC2F6	LVPECL	Driver	2	8
CAT16-PC4F12	LVPECL	Driver	4	16
CAT16-PT2F2	LVDS/LVPECL	Receiver	2	8
CAT16-PT4F4	LVDS/LVPECL	Receiver	4	16

### 3.4 Mixed I/O Systems

The use of different supply voltages and terminating resistors allows the OCX160 to support LVDS / LVPECL translation as well as switching as outlined in Table 14.

**Table 14 Supply Voltages and Terminating Resistors**

Input	Output	V <sub>DD.PAD</sub>	R <sub>T</sub>	R <sub>S</sub>	R <sub>DIV</sub>
LVDS	LVDS	2.5V	100Ω	165Ω	140Ω
LVPECL	LVDS	2.5V	100Ω	165Ω	140Ω
LVDS	LVPECL	3.3V	100Ω	100Ω	187Ω
LVPECL	LVPECL	3.3V	100Ω	100Ω	187Ω

**NOTES:**

1. V<sub>DD.IN</sub> = 3.3V ±10%, V<sub>DD.CORE</sub> = 2.5V ±5%
2. It is not possible to mix LVDS and LVPECL outputs on a device

## 4. Electrical Specifications

### 4.1 Absolute Maximum Ratings

**Table 15 Absolute Maximum Ratings<sup>1</sup>**

Symbol	Parameter	Limits	Units
V <sub>DD</sub> .CORE	Supply Voltage (core)	-0.3 to +3.0	V
V <sub>DD</sub> .IN	Supply Voltage (inputs)	-0.3 to +3.6	V
V <sub>DD</sub> .PAD	Supply Voltage (differential outputs)	-0.3 to +3.6	V
V <sub>IN</sub> <sup>2</sup>	Input Voltage	-0.3 to +3.6 <sup>3</sup>	V
T <sub>J</sub>	Junction Temperature	+150	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
P <sub>MAX</sub>	Maximum Power Dissipation	6	W
ESD <sup>6</sup>	Electrostatic Discharge	2000	V

### 4.2 Recommended Operating Conditions

**Table 16 Recommended Operating Conditions**

Symbol	Parameter	Limits	Units
V <sub>DD</sub> .CORE	Supply Voltage (core)	+2.375 to +2.625	V
V <sub>DD</sub> .PAD <sup>4</sup>	Supply Voltage (differential output buffers)	3.3V ±10% to 2.5V ±5%	V
V <sub>DD</sub> .IN	Supply Voltage (inputs)	+3.0 to +3.6	V
T <sub>A</sub>	Operating Temperature: Commercial Operating Temperature: Industrial	0 to +70 -40 to +85	°C

### 4.3 Pin Capacitance

**Table 17 Pin Capacitance<sup>5</sup>**

Symbol	Parameter	Max	Units
CPIN	Signal Pin Capacitance	10	pF

1. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
2. A maximum undershoot of 2V for a maximum duration of 20 ns is acceptable. Overshoot to 3.6V is acceptable.
3. All inputs are 3.3V tolerant with the V<sub>DD</sub> pin at 2.5V or 3.3V.
4. Note that min and max values for V<sub>DD</sub> for differential outputs are I/O Standard dependent.
5. Capacitance measured at 25°C. Sample tested only.
6. Measured using Human Body Model.

## 4.4 DC Electrical Specifications

( $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{DD.IN} = 3.3\text{V} \pm 10\%$ ,  $V_{DD.CORE} = 2.5\text{V} \pm 5\%$ )

**Table 18 LVTTTL DC Electrical Specifications**

Symbol	Parameter	Conditions	Min	Max	Units
$V_{IH}$	High-level Input	Ports are 3.3V tolerant	2.0	3.6	V
$V_{IL}$	Low-level Input	Ports are 3.3V tolerant	-0.3	0.8	V
$V_{OH}$	High-level Output	$V_{DD.PAD} = \text{Min}$ $I_{OH} = -4\text{mA}$	2.4	$V_{DD.PAD} + 0.3$	V
$V_{OL}$	Low-level Output	$V_{DD.PAD} = \text{Min}$ $I_{OL} = 8\text{mA}$		0.4	V
$IL_{IH}, IL_{IL}^{(1)}$	Input Pin Leakage Current	$V_{DD.IN} = \text{Max}$ $0.0 < I_n < V_{DD.PAD}$		+5 -50	$\mu\text{A}$
$IL_{OZ}$	Tristate Leakage Output OFF State	$V_{DD.PAD} = \text{Max}$ $0.0 < I_n < V_{DD.PAD}$		+5 -5	$\mu\text{A}$
<b>Power</b>					
$P_{DDQ}^{(2)}$	Quiescent Power	All $V_{DD} = \text{Max}$		0.5	W

**Table 19 LVDS DC Electrical Specifications**

DC Parameter	Min	Typ	Max	Units
Output High Voltage for OUP and OUTN <sup>(3)</sup>			1.6	V
Output Low Voltage for OUP and OUTN	0.90			V
Differential Output Voltage <sup>(5)</sup>	250	350	450	mV
Output Common-Mode Voltage	1.125	1.25	1.375	V
Differential Input Voltage	100	350		mV
Input Common-Mode Voltage	0.25	1.25	2.25	V

1. All LVTTTL input pins have pull-up resistors.
2. See section 6 for dynamic power consumption calculation.
3. Refer to Figures 7 and 8 for termination resistor.
4. Refer to Figures 9 and 10 for termination resistor.
5. Maximum capacitive load is 12 pF.

**Table 20 LVPECL DC Electrical Specifications**

DC Parameters	Min	Max
$V_{IH}^{(4)}$	$V_{DD.PAD} - 1.165$	$V_{DD.PAD} - 0.880$
$V_{IL}$	$V_{DD.PAD} - 1.810$	$V_{DD.PAD} - 1.475$
$V_{OH}$	1.80	2.40
$V_{OL}$	0.95	1.55

These values in Table 20 are valid at the output of the source termination pack, as shown in sections 3.2 and 3.3, with a 100 $\Omega$  differential load only. The  $V_{OH}$  levels are 200mV below LVPECL levels and are compatible with devices tolerant of lower common-mode ranges. The above table summarizes the DC output specifications of LVPECL.

## 4.5 AC Electrical Specifications

( $V_{DD-IN} = 3.3V \pm 10\%$ ,  $V_{DD-CORE} = 2.5V \pm 5\%$ )

**Table 21 AC Electrical Specifications**

Symbol	Parameter	0°C to 70°C		-40°C to +85°C		Units
		Min	Max	Min	Max	
$R_{DATA}$	NRZ Data Rate <sup>(1)</sup>		667		667	Mb/s
$F_{RO}$	Registered Output Clock Frequency <sup>(1)</sup>		333		333	MHz
$t_{W\_RO}$	Registered Clock Pulse Width, High or Low <sup>(1)</sup>	2		2		ns
$t_{S\_RO}$	Registered Output Setup Time to Clock	4		4		ns
$t_{H\_RO}$	Registered Output Clock to Hold Data	0		0		ns
$t_{CO\_RO}$	Registered Output Clock to Data Out Valid		2.5		2.5	ns
$t_{PHL}$ , $t_{PLH}$	One Way Signal Propagation Delay, Fanout = 1		5.5		6.5	ns
$t_{W+}$	Input Flow-through Positive Pulse Width	1.5		1.5		ns
$t_{W-}$	Input Flow-through Negative Pulse Width	1.5		1.5		ns
$t_{DCD+}$ , $t_{DCD-}$	Duty Cycle Distortion		0.5		0.6	ns
$t_{JITTER}$	Output Jitter	TBD	TBD	TBD	TBD	ps
$t_{SK}$	Skew between Output Ports <sup>(1)</sup>		0.5		0.6	ns
$t_{PHZ\_OT}$ , $t_{PLZ\_OT}$	Output Enable to Valid Data		3		3	ns
$t_{PZH\_OT}$ , $t_{PZL\_OT}$	Output Enable to High Z State		3		3	ns
$t_{RC}$	RapidConfigure Clock Period	12		12		ns
$t_{W+\_RC}$ , $t_{W-\_RC}$	RapidConfigure Clock Pulse Width	5		5		ns
$t_{S\_RC}$	RapidConfigure Address Setup to RC_CLK#	3		4		ns
$t_{H\_RC}$	RapidConfigure Address and Enable Hold Time to RC_CLK#	3		4		ns
$t_{P\_UD}$	Update of Crosspoint to Data Out		10		10	ns
$f_{JTAG}$	JTAG Clock Frequency (TCK)		20		20	MHz
$t_{W\_JTAG}$	JTAG Clock Pulse Width (TCK) @ 20MHz cycle	20	30	20	30	ns
$t_{S\_JTAG}$	JTAG Setup Time	4		4		ns
$t_{H\_JTAG}$	JTAG Hold Time	0		0		ns
$t_{P\_JTAG}$	JTAG Clock to Output Data Valid (TDO)		20		20	ns

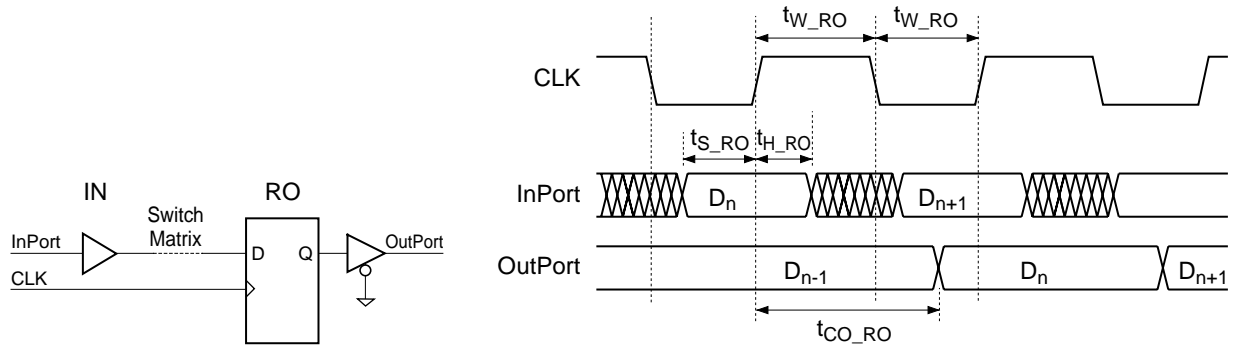

**NOTES:**

1. These parameters are guaranteed but not tested in production.

### 4.6 Timing Diagrams

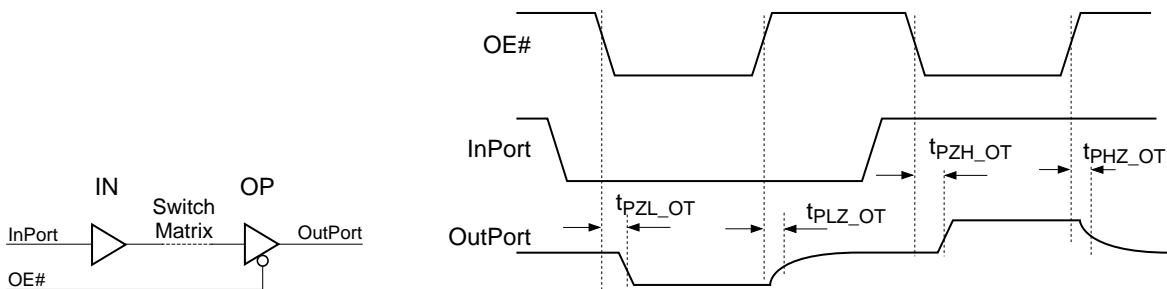

**Note** – For the purpose of clarity, the timing diagrams within this data sheet are conceptual representations only and do not show actual circuit implementation.

5.4 Package Dimensions

Figure 21 OCX160 Package—Bottom, Top and Side Views

## 5.5 Package Thermal Characteristics

Table 24 Package Thermal Coefficients

Package	Pin Count	$\Theta_{JC}(C/W)$	$\Theta_{JA}(^{\circ}C/W)$ Still Air
PBGA	420	1.7°C/W	12°C/W

**NOTE:**

1. Thermal performance values are based on simulation data.

## 6. Power Consumption

There are two main factors to consider when calculating power consumption for the OCX160:

- Power consumed by the chip
- Power dissipated by the terminating resistors at the switch differential outputs

The first component, chip power, consists of three integral elements (refer to Figure 22):

1. **Input Power**—This element is fixed (always ON) due to the DC current for differential outputs.
2. **Core Power**—This element is the same for LVDS or LVPECL outputs. Core power is a function of data rate (Mb/s) and the number of connection paths through the switch matrix.
3. **Output Power**—This element is a fixed amount for each differential output. The value is zero if the Output Enable (OE#) is disabled or set to OFF.

The second component, termination power, is the power dissipated by the terminating resistors at the switch differential outputs. The value is zero if the Output Enable (OE#) is disabled or set to OFF.

The following diagram shows the chip power elements (as described above), the formulas used for determining chip power, and the total power consumption as determined by the formula [**Chip Power + Termination Power**].

### 6.1 Power for LVDS I/O

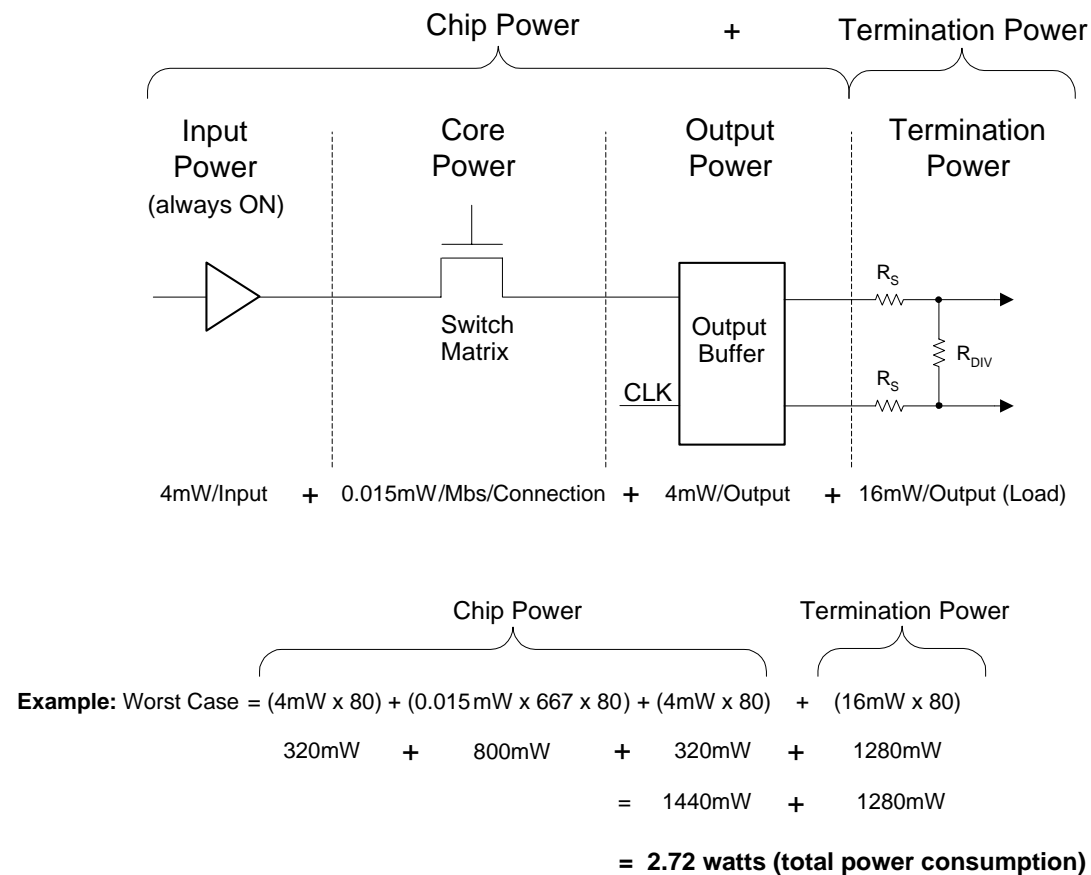

Figure 22 Power Consumption Diagram for the OCX160 using LVDS

## 6.2 Power for LVPECL I/O

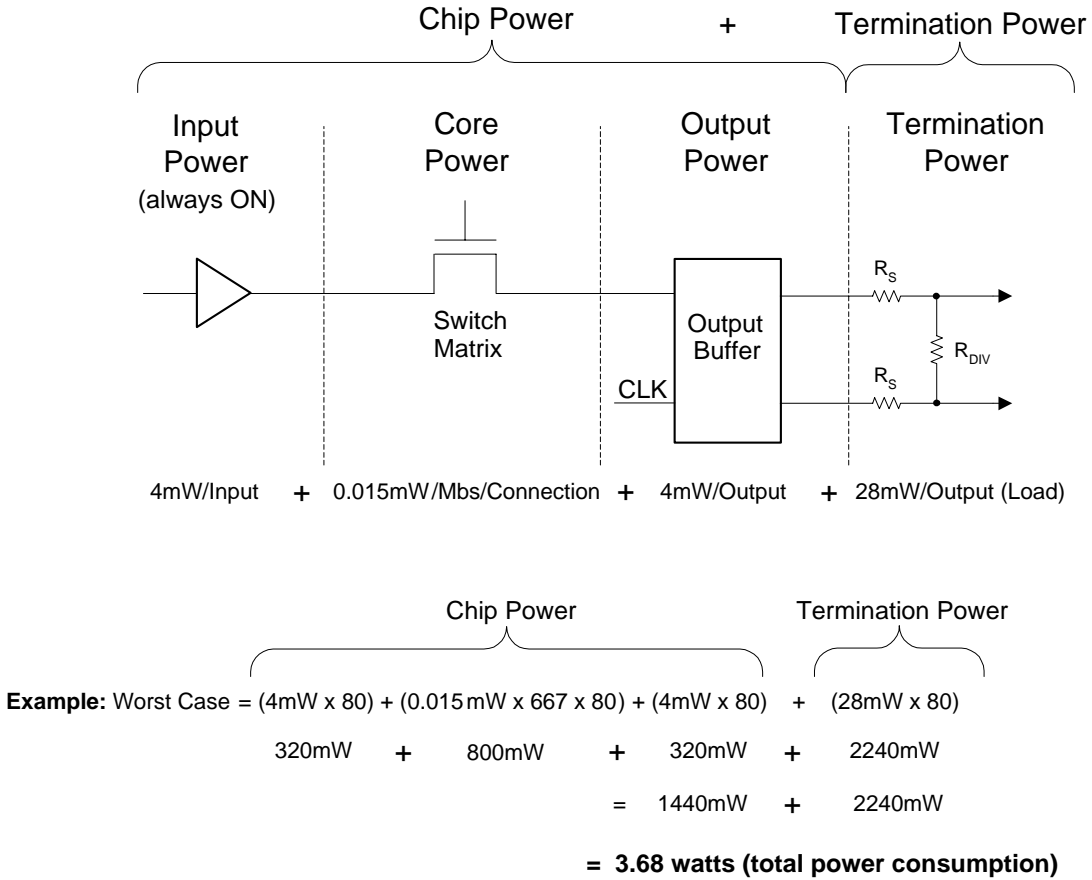

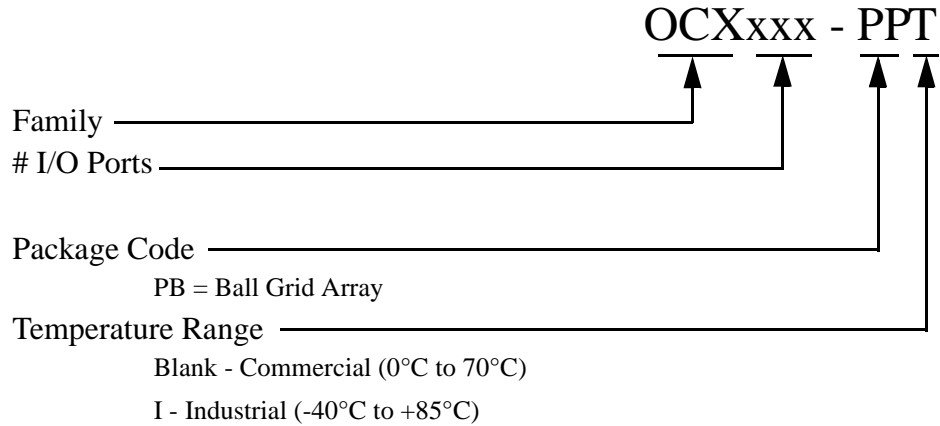

Figure 23 Power Consumption Diagram for the OCX160 using LVPECL

7. Component Availability and Ordering Information

8. Glossary

**CLOCK:** A single differential input used to gate data into registers in the Output Buffer. The input serves all outputs of the OCX. The neighbor input can also be used as a register clock.

**CROSSPOINT:** A single cell controlled by two RAM bits. The RAM bits are connected in a master-slave configuration to provide an update for programming and changing program information all at once.

**CROSSPOINT ARRAY:** An array of Crosspoint cells used to connect any input port to any output port.

**INPUT OR OUTPUT PATH:** The signal flow from pin to array and array to pin. Each path has a register with selectable clocks, drivers for the loaded outputs with selectable enables, and sense circuits to detect changes on either side of the IO Buffer.

**NEXT NEIGHBOR:** A physically adjacent port can be used as a clock source for an output configured in registered mode. These outputs are grouped in pairs such that the signal being switched through Output 0 can be used to clock the signal being switched through Output 1, or vice-versa. Any single clock or data input signal can be used to clock any other input signal provided they are switched to an appropriate output pair.

**PORT:** A name followed by a number to identify a pin on the device.

**RAPIDCONFIGURE:** A parallel programming method for the OCX devices. The RC mode uses 25 dedicated pins to program the Crosspoint Array and the IO Buffers. The 25 pins consist of an enable, a clock, four instruction bits, two seven-bit address fields, and a five-bit data field.

## Revision History

Date/	Version No.	Description
6/16/2000	Revision 1.0	Initial release of “Advanced” data sheet
9/25/00	Revision 1.1	Additions include RCO output pin information, pinout drawing, pinout tables, package dimensions and illustration, duty-cycle diagram, thermal characteristics table, device reset options table, a section on configuring multiple devices, bitstream generation and downloading, JTAG information, and Power Consumption information/illustrations.
10/20/00	Revision 1.2	Corrections to RC Programming table. Additions/corrections to multiple tables and timing diagrams.
11/16/00	Revision 1.3	Updated RapidConfigure Read Cycle timing diagram so that RCO is relative to RC_CLK#; RCO was previously relative to RC_EN#. Replaced “+” on signal names to “P” and “-” to “N”. Corrected RCO[4:0] pin locations. Changed product status definition from Advanced to Preliminary.
11/21/00	Revision 1.4	Corrected Pinout drawing and Pinout tables to reflect that “P” and “N” are reversed on OUT40 to OUT79.
12/14/00	Revision 1.5	Corrections to Table 22 “Pinout By Ball Sequence” to match Pinout drawing—changed ball name on T4 and T5 from OUT49N and OUT49P to OUT49P and OUT49N respectively; ball # for IN07P corrected from AD20 to AE20. Corrections to Table 23 “Pinout By Ball Name” to match Pinout drawing—corrected IN07P ball # from AD20 to AE20; corrected OUT49P (T5) and OUT49N (T4) to be OUT49N (T5) and OUT49P (T4); corrected OUT50P (AA2) and OUT50N (AA3) to be OUT50N (AA2) and OUT50P (AA3).
1/20/2001	Revision 1.6	Changed the $V_{IH}$ , $V_{IL}$ , $V_{OH}$ , and $V_{OL}$ minimum and maximum values for LVPECL DC specifications in Table 20; added a note below table explaining the current values; changed Pass Transistor to proprietary high-performance buffering circuit.

**9. Product Status Definition**

<b>Data Sheet Identification</b>	<b>Product Status</b>	<b>Definition</b>
<b>Advanced</b>	Formative or In Design	This data sheet contains the design specifications for product development. Specification may change in any manner without notice.
<b>Preliminary</b>	Preproduction Product	This data sheet contains the preliminary data, and supplementary data will be published at a later date. I-Cube reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
<b>No Identification</b>	Full Production	This data sheet contains final specifications. I-Cube reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
<b>Obsolete</b>	No longer in Production	This data sheet contains specifications for a product that has been discontinued by I-Cube. The data sheet is provided for reference information only.
