

128Mbit DDR SDRAM

2M x 16Bit x 4 Banks
Double Data Rate Synchronous DRAM

Revision 1.4

August 2002

Samsung Electronics reserves the right to change products or specification without notice.

Revision History**Revision 1.4 (August 13, 2002)**

- Changed ICC3P
- Typo corrected
- Changed refresh period of K4D28163HD-TC36/40 from 4K/64ms to 4K/32ms.

Revision 1.3 (May 29, 2002)

- Added K4D28163HD-TC36 (275MHz)

Revision 1.2 (May 8, 2002)

- Typo corrected

Revision 1.1 (January 7, 2002)

- Increased Icc2N by 20mA

Revision 1.0 (December 22, 2001)

- Defined DC spec.

Revision 0.4 (December 10, 2001) - Target Spec

- Removed Full page Burst Length from the spec.

Revision 0.3 (November 6, 2001) - Target Spec

- Removed K4D28163HD-TC45/55 from the spec.

Revision 0.2 (October 25, 2001) - Target Spec

- Removed K4D28163HD-TC33/36 from the spec.

Revision 0.1 (October 12, 2001) - Target Spec

- Changed VDD from 3.3V \pm 10% to 3.3V \pm 5%

Revision 0.0 (October 10, 2001) - Target Spec

- Defined Target Specification

K4D28163HD

128M DDR SDRAM

2M x 16Bit x 4 Banks Double Data Rate Synchronous DRAM with Bi-directional Data Strobe and DLL

FEATURES

- 3.3V \pm 5% power supply for device operation
- 2.5V \pm 5% power supply for I/O interface
- SSTL_2 compatible inputs/outputs
- 4 banks operation
- MRS cycle with address key programs
 - . Read latency 3 (clock)
 - . Burst length (2, 4 and 8)
 - . Burst type (sequential & interleave)
- All inputs except data & DM are sampled at the positive going edge of the system clock
- Differential clock input
- No Write-Interrupted by Read Function
- 2 DQS' s (1DQS / Byte)
- Data I/O transactions on both edges of Data strobe
- DLL aligns DQ and DQS transitions with Clock transition
- Edge aligned data & data strobe output
- Center aligned data & data strobe input
- DM for write masking only
- Auto & Self refresh
- 32ms refresh period (4K cycle) for -36/-40
- 64ms refresh period (4K cycle) for -50/-60
- 66pin TSOP-II
- Maximum clock frequency up to 275MHz
- Maximum data rate up to 550Mbps/pin

ORDERING INFORMATION

Part NO.	Max Freq.	Max Data Rate	Interface	Package
K4D28163HD-TC36	275MHz	550Mbps/pin	SSTL_2	66pin TSOP-II
K4D28163HD-TC40	250MHz	500Mbps/pin		
K4D28163HD-TC50	200MHz	400Mbps/pin		
K4D28163HD-TC60	166MHz	333Mbps/pin		

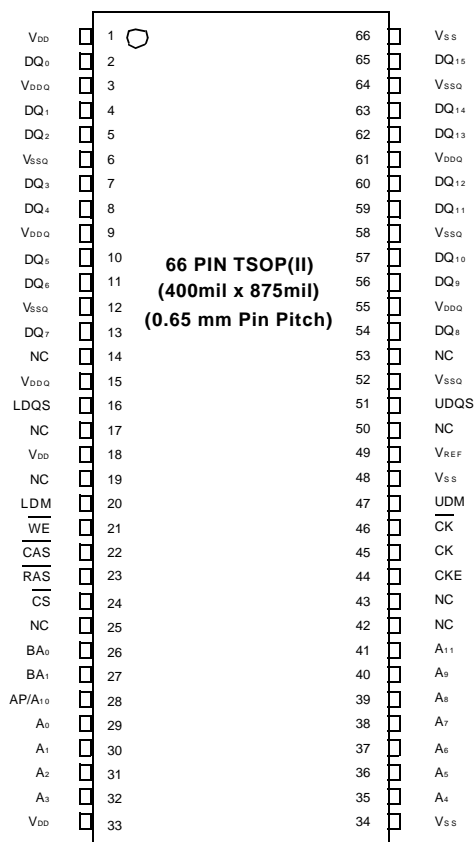

GENERAL DESCRIPTION

FOR 2M x 16Bit x 4 Bank DDR SDRAM

The K4D28163HD is 134,217,728 bits of hyper synchronous data rate Dynamic RAM organized as 4 x 2,097,152 words by 16 bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous features with Data Strobe allow extremely high performance up to 1.1GB/s/chip. I/O transactions are possible on both edges of the clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the device to be useful for a variety of high performance memory system applications.

PIN CONFIGURATION (Top View)

PIN DESCRIPTION

CK, $\overline{\text{CK}}$	Differential Clock Input	BA0, BA1	Bank Select Address
CKE	Clock Enable	A0 ~ A11	Address Input
$\overline{\text{CS}}$	Chip Select	DQ0 ~ DQ15	Data Input/Output
$\overline{\text{RAS}}$	Row Address Strobe	VDD	Power
$\overline{\text{CAS}}$	Column Address Strobe	VSS	Ground
WE	Write Enable	VDDQ	Power for DQ's
LDQS, UDQS	Data Strobe	VSSQ	Ground for DQ's
LDM, UDM	Data Mask	NC	No Connection
RFU	Reserved for Future Use		

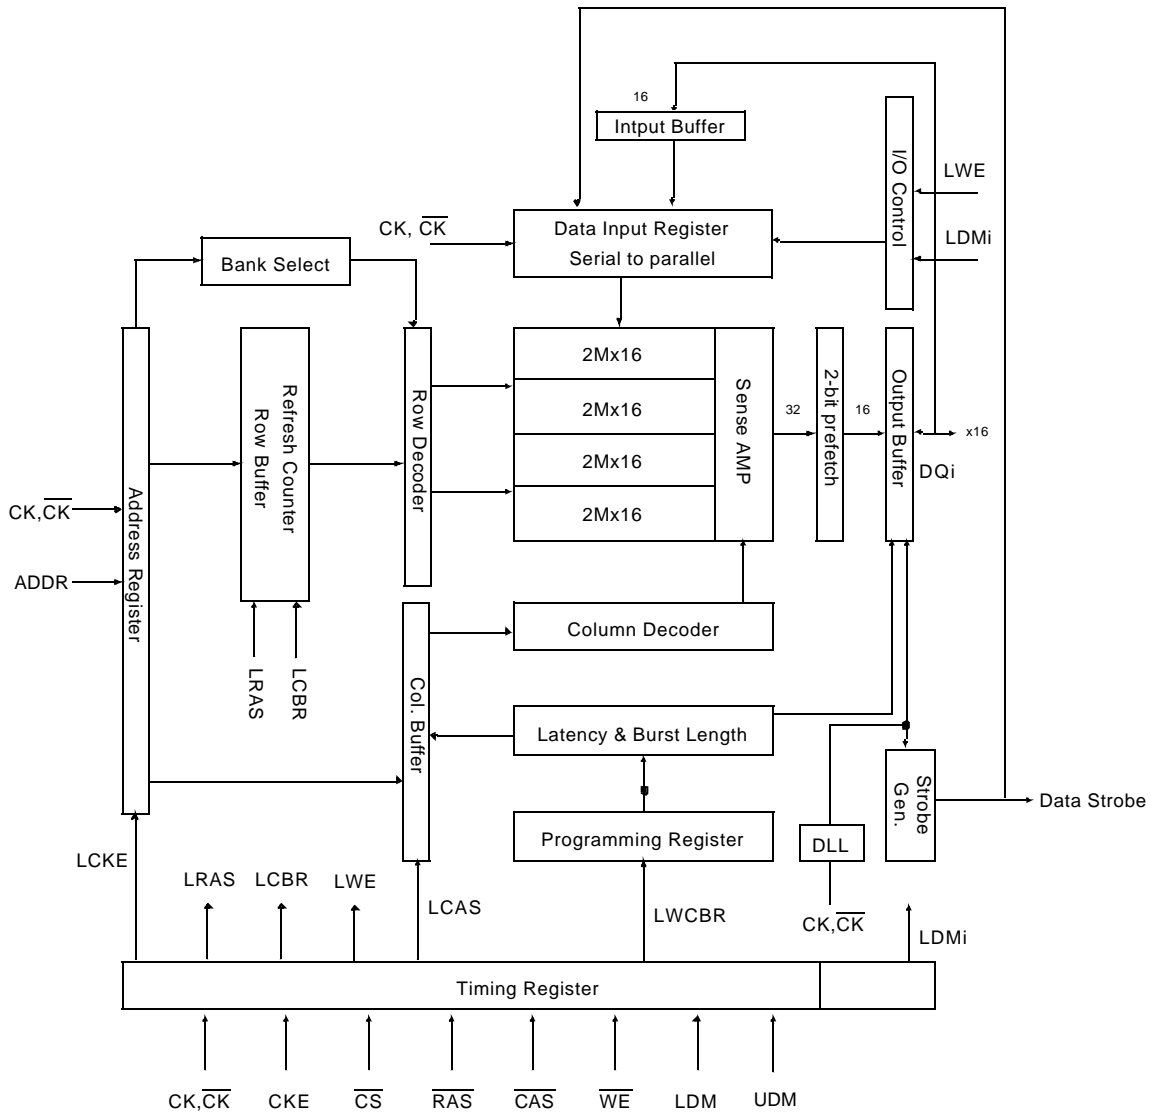

INPUT/OUTPUT FUNCTIONAL DESCRIPTION

Symbol	Type	Function
CK, $\overline{\text{CK}}^{*1}$	Input	The differential system clock Input. All of the inputs are sampled on the rising edge of the clock except DQ's and DM's that are sampled on both edges of the DQS.
CKE	Input	Activates the CK signal when high and deactivates the $\overline{\text{CK}}$ signal when low. By deactivating the clock, CKE low indicates the Power down mode or Self refresh mode.
$\overline{\text{CS}}$	Input	$\overline{\text{CS}}$ enables the command decoder when low and disabled the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue.
$\overline{\text{RAS}}$	Input	Latches row addresses on the positive going edge of the CK with $\overline{\text{RAS}}$ low. Enables row access & precharge.
$\overline{\text{CAS}}$	Input	Latches column addresses on the positive going edge of the CK with $\overline{\text{CAS}}$ low. Enables column access.
$\overline{\text{WE}}$	Input	Enables write operation and row precharge. Latches data in starting from $\overline{\text{CAS}}$, $\overline{\text{WE}}$ active.
LDQS,(U)DQS	Input/Output	Data input and output are synchronized with both edge of DQS. For the x16, LDQS corresponds to the data on DQ0-DQ7 ; UDQS corresponds to the data on DQ8-DQ15.
LDM,UDM	Input	Data in Mask. Data In is masked by DM Latency=0 when DM is high in burst write. For the x16, LDM corresponds to the data on DQ0-DQ7 ; UDM corresponds to the data on DQ8-DQ15.
DQ0 ~ DQ15	Input/Output	Data inputs/Outputs are multiplexed on the same pins.
BA0, BA1	Input	Selects which bank is to be active.
A0 ~ A11	Input	Row/Column addresses are multiplexed on the same pins. Row addresses : RA0 ~ RA11, Column addresses : CA0 ~ CA8.
VDD/VSS	Power Supply	Power and ground for the input buffers and core logic.
VDDQ/VSSQ	Power Supply	Isolated power supply and ground for the output buffers to provide improved noise immunity.
VREF	Power Supply	Reference voltage for inputs, used for SSTL interface.
NC/RFU	No connection/ Reserved for future use	This pin is recommended to be left "No connection" on the device

*1 : The timing reference point for the differential clocking is the cross point of CK and $\overline{\text{CK}}$.

For any applications using the single ended clocking, apply VREF to $\overline{\text{CK}}$ pin.

BLOCK DIAGRAM (2Mbit x 16I/O x 4 Bank)

Downloaded from Elcodis.com electronic components distributor

FUNCTIONAL DESCRIPTION

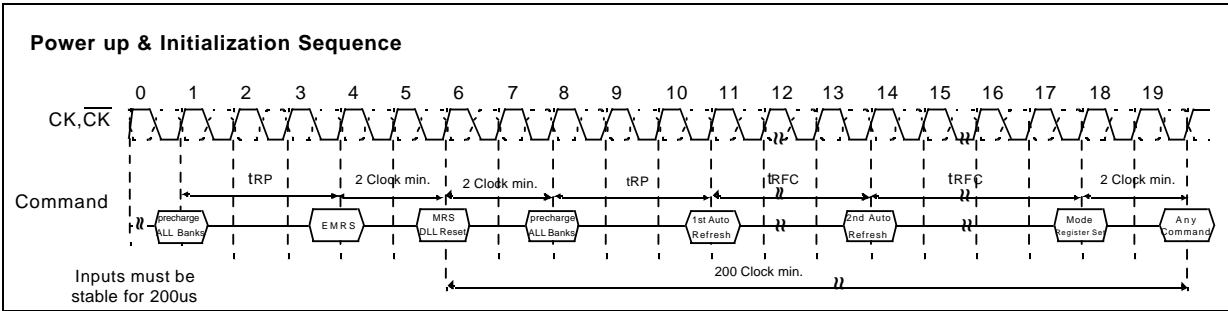

• **Power-Up Sequence**

DDR SDRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

1. Apply power and keep CKE at low state (All other inputs may be undefined)
 - Apply VDD before VDDQ .
 - Apply VDDQ before VREF & VTT
2. Start clock and maintain stable condition for minimum 200us.
3. The minimum of 200us after stable power and clock(CK,CK \bar{K}), apply NOP and take CKE to be high .
4. Issue precharge command for all banks of the device.
5. Issue a EMRS command to enable DLL
- *1 6. Issue a MRS command to reset DLL. The additional 200 clock cycles are required to lock the DLL.
- *1,2 7. Issue precharge command for all banks of the device.
8. Issue at least 2 or more auto-refresh commands.
9. Issue a mode register set command with A8 to low to initialize the mode register.

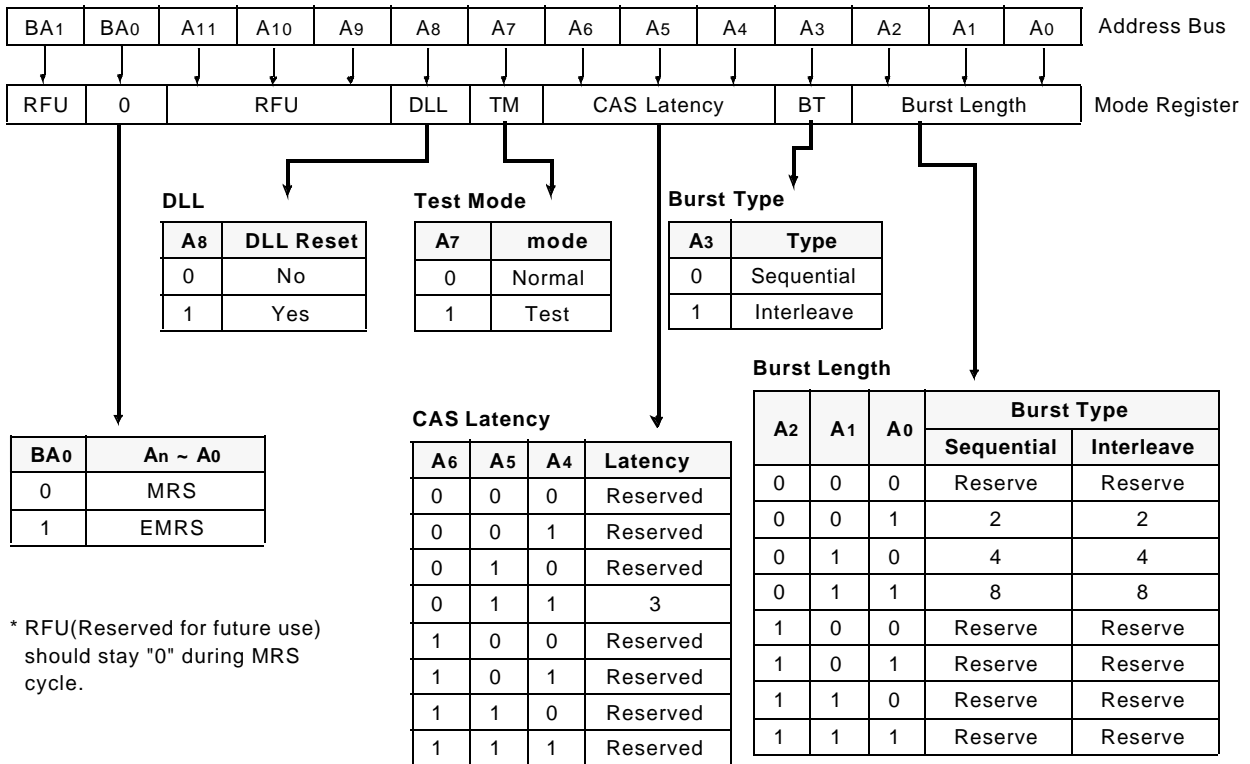

*1 The additional 200cycles of clock input is required to lock the DLL after enabling DLL.

*2 Sequence of 6&7 is regardless of the order.

MODE REGISTER SET(MRS)

The mode register stores the data for controlling the various operating modes of DDR SDRAM. It programs $\overline{\text{CAS}}$ latency, addressing mode, burst length, test mode, DLL reset and various vendor specific options to make DDR SDRAM useful for variety of different applications. The default value of the mode register is not defined, therefore the mode register must be written after EMRS setting for proper operation. The mode register is written by asserting low on $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ (The DDR SDRAM should be in active mode with $\overline{\text{CKE}}$ already high prior to writing into the mode register). The state of address pins A0 ~ A11 and BA0, BA1 in the same cycle as $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ going low is written in the mode register. Minimum two clock cycles are requested to complete the write operation in the mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. The mode register is divided into various fields depending on functionality. The burst length uses A0 ~ A2, addressing mode uses A3, $\overline{\text{CAS}}$ latency(read latency from column address) uses A4 ~ A6. A7 is used for test mode. A8 is used for DLL reset. A7,A8, BA0 and BA1 must be set to low for normal MRS operation. Refer to the table for specific codes for various burst length, addressing modes and $\overline{\text{CAS}}$ latencies.

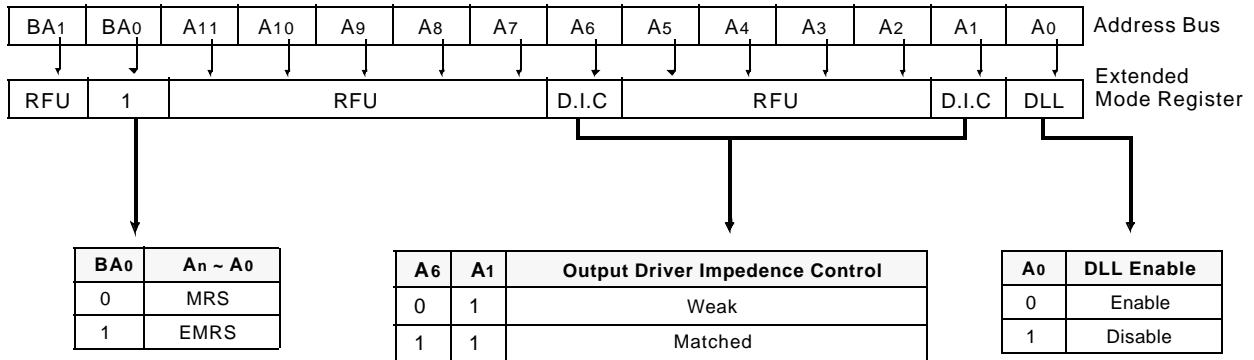

* RFU(Reserved for future use) should stay "0" during MRS cycle.

*1 : MRS can be issued only at all banks precharge state.
 *2 : Minimum trp is required to issue MRS command.

EXTENDED MODE REGISTER SET(EMRS)

The extended mode register stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore the extended mode register must be written after power up for enabling or disabling DLL. The extended mode register is written by asserting low on CS, RAS, CAS, WE and high on BA0(The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register). The state of address pins A0, A2 ~ A5, A7 ~ A11 and BA1 in the same cycle as CS, RAS, CAS and WE going low are written in the extended mode register. A1 and A6 are used for setting driver strength to normal, weak or matched impedance. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. All the other address pins except A0,A1,A6 and BA0 must be set to low for proper EMRS operation. Refer to the table for specific codes.

*1 : RFU(Reserved for future use) should stay "0" during EMRS cycle.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to Vss	VIN, VOUT	-0.5 ~ 3.6	V
Voltage on VDD supply relative to Vss	VDD	-1.0 ~ 3.6	V
Voltage on VDD supply relative to Vss	VDDQ	-0.5 ~ 3.6	V
Storage temperature	TSTG	-55 ~ +150	°C
Power dissipation	PD	1.0	W
Short circuit current	Ios	50	mA

Note : Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

POWER & DC OPERATING CONDITIONS(SSTL_2 In/Out)

Recommended operating conditions(Voltage referenced to VSS=0V, TA=0 to 65°C)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Device Supply voltage	VDD	3.135	3.3	3.465	V	1
Output Supply voltage	VDDQ	2.375	2.50	2.625	V	1
Reference voltage	VREF	0.49*VDDQ	-	0.51*VDDQ	V	2
Termination voltage	Vtt	VREF-0.04	VREF	VREF+0.04	V	3
Input logic high voltage	VIH(DC)	VREF+0.15	-	VDDQ+0.30	V	4
Input logic low voltage	VIL(DC)	-0.30	-	VREF-0.15	V	5
Output logic high voltage	VOH	Vtt+0.76	-	-	V	Ioh=-15.2mA
Output logic low voltage	VOL	-	-	Vtt-0.76	V	IOL=+15.2mA
Input leakage current	IIL	-5	-	5	uA	6
Output leakage current	IOL	-5	-	5	uA	6

Note : 1. Under all conditions VDDQ must be less than or equal to VDD.

2. VREF is expected to equal 0.50*VDDQ of the transmitting device and to track variations in the DC level of the same. Peak to peak noise on the VREF may not exceed + 2% of the DC value. Thus, from 0.50*VDDQ, VREF is allowed + 25mV for DC error and an additional + 25mV for AC noise.

3. Vtt of the transmitting device must track VREF of the receiving device.

4. VIH(max.)= VDDQ +1.5V for a pulse width and it can not be greater than 1/3 of the cycle rate.

5. VIL(min.)= -1.5V for a pulse width and it can not be greater than 1/3 of the cycle rate.

6. For any pin under test input of $0V \leq V_{IN} \leq VDD$ is acceptable. For all other pins that are not under test $V_{IN}=0V$.

DC CHARACTERISTICS

Recommended operating conditions Unless Otherwise Noted, TA=0 to 65°C)

Parameter	Symbol	Test Condition	Version				Unit	Note
			-36	-40	-50	-60		
Operating Current (One Bank Active)	Icc1	Burst Lenth=2 trc ≥ trc(min) IoL=0mA, tcc= tcc(min)	200	190	170	165	mA	1
Precharge Standby Current in Power-down mode	Icc2P	CKE ≤ VIL(max), tcc= tcc(min)	5				mA	
Precharge Standby Current in Non Power-down mode	Icc2N	CKE ≥ VIH(min), CS ≥ VIH(min), tcc= tcc(min)	70	65	60	60	mA	
Active Standby Current power-down mode	Icc3P	CKE ≤ VIL(max), tcc= tcc(min)	100	90	75	70	mA	
Active Standby Current in in Non Power-down mode	Icc3N	CKE ≥ VIH(min), CS ≥ VIH(min), tcc= tcc(min)	130	120	110	90	mA	
Operating Current (Burst Mode)	Icc4	trc ≥ trFC(min)trc ≥ trFC(min) Page Burst, All Banks activated.	380	350	310	280	mA	
Refresh Current	Icc5	trc ≥ trFC(min)	250	220	210	200	mA	
Self Refresh Current	Icc6	CKE ≤ 0.2V	2				mA	

Note : 1. Measured with outputs open.

AC INPUT OPERATING CONDITIONS

Recommended operating conditions(Voltage referenced to VSS=0V, VDD=3.3V± 5%, VDDQ=2.5V± 5%,TA=0 to 65°C)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Input High (Logic 1) Voltage; DQ	VIH	VREF+0.35	-	-	V	
Input Low (Logic 0) Voltage; DQ	VIL	-	-	VREF-0.35	V	
Clock Input Differential Voltage; CK and \overline{CK}	VID	0.7	-	VDDQ+0.6	V	1
Clock Input Crossing Point Voltage; CK and \overline{CK}	VIX	0.5*VDDQ-0.2	-	0.5*VDDQ+0.2	V	2

Note : 1. VID is the magnitude of the difference between the input level on CK and the input level on \overline{CK}

2. The value of VIX is expected to equal 0.5*VDDQ of the transmitting device and must track variations in the DC level of the same

AC OPERATING TEST CONDITIONS ($V_{DD}=3.3V\pm 5\%$, $T_A= 0$ to $65^\circ C$)

Parameter	Value	Unit	Note
Input reference voltage for CK(for single ended)	$0.50 \cdot V_{DDQ}$	V	
CK and \overline{CK} signal maximum peak swing	1.5	V	
CK signal minimum slew rate	1.0	V/ns	
Input Levels(V_{IH}/V_{IL})	$V_{REF}+0.35/V_{REF}-0.35$	V	
Input timing measurement reference level	V_{REF}	V	
Output timing measurement reference level	V_{tt}	V	
Output load condition	See Fig.1		

(Fig. 1) Output Load Circuit

CAPACITANCE ($V_{DD}=3.3V$, $T_A= 25^\circ C$, $f=1MHz$)

Parameter	Symbol	Min	Max	Unit
Input capacitance(CK, \overline{CK})	CIN1	1.0	5.0	pF
Input capacitance(A0~A11, BA0~BA1)	CIN2	1.0	4.0	pF
Input capacitance (CKE, CS, RAS,CAS, \overline{WE})	CIN3	1.0	4.0	pF
Data & DQS input/output capacitance(DQ0~DQ31)	COUT	1.0	6.5	pF
Input capacitance(DM0 ~ DM3)	CIN4	1.0	6.5	pF

DECOUPLING CAPACITANCE GUIDE LINE

Recommended decoupling capacitance added to power line at board.

Parameter	Symbol	Value	Unit
Decoupling Capacitance between VDD and VSS	CDC1	$0.1 + 0.01$	μF
Decoupling Capacitance between VDDQ and VSSQ	CDC2	$0.1 + 0.01$	μF

- Note :**
1. VDD and VDDQ pins are separated each other.
All VDD pins are connected in chip. All VDDQ pins are connected in chip.
 2. VSS and VSSQ pins are separated each other
All VSS pins are connected in chip. All VSSQ pins are connected in chip.

Clock half period		tHP	tCLmin or tCHmin	-	tCLmin or tCHmin	-	tCLmin or tCHmin	-	tCLmin or tCHmin	-	ns	1
Data output hold time from DQS		tQH	tHP-0.4	-	tHP-0.4	-	tHP-0.45	-	tHP-0.5	-	ns	1

Note 1 :

- The JEDEC DDR specification currently defines the output data valid window(tDV) as the time period when the data strobe and all data associated with that data strobe are coincidentally valid.
- The previously used definition of tDV(=0.35tCK) artificially penalizes system timing budgets by assuming the worst case output valid window even then the clock duty cycle applied to the device is better than 45/55%
- A new AC timing term, tQH which stands for data output hold time from DQS is defined to account for clock duty cycle variation and replaces tDV
- tQHmin = tHP-X where
 - . tHP=Minimum half clock period for any given cycle and is defined by clock high or clock low time(tCH,tCL)
 - . X=A frequency dependent timing allowance account for tDQSQmax
